

Mathematics

Question1

If  $D \subseteq R$  and  $f : D \rightarrow R$  defined by  $f(x) = \frac{x^2+x+a}{x^2-x+a}$  is a surjection, then '  $a$  ' lies in the interval.

Options:

A.

$R$

B.

$(0, \infty)$

C.

$(-\infty, 0)$

D.

$(0, 1)$

Answer: C

Solution:

$$f(x) = \frac{x^2+x+a}{x^2-x+a}$$

$\therefore f(x)$  is surjection, then range = Codomain

$$\text{Range} = R$$

Now for range, put  $f(x) = y$ .

$$y = \frac{x^2 + x + a}{x^2 - x + a}$$

$$x^2(y - 1) - x(y + 1) + ay - a = 0$$

Now  $x \in R \Rightarrow D \geq 0$

$$\begin{aligned}
(y+1)^2 - 4(y-1)(ay-a) &\geq 0 \\
\Rightarrow (y+1)^2 - 4a(y-1)^2 &\geq 0, \forall y \in R \\
\Rightarrow y^2(1-4a) + y(2+8a) + 1-4a &\geq 0, \forall y \in R \\
\therefore 1-4a &\geq 0 \text{ and } D \leq 0 \\
a &\leq \frac{1}{4} \text{ and } (2+8a)^2 - 4(1-4a)^2 \leq 0 \\
\Rightarrow (1+4a)^2 - (1-4a)^2 &\leq 0 \\
\Rightarrow (1+4a+1-4a)(1+4a-1+4a) &\leq 0 \\
\Rightarrow 2(8a) &\leq 0 \\
\Rightarrow a &\leq 0 \\
\therefore a &\in (-\infty, 0).
\end{aligned}$$

---

## Question2

If the domain of the real valued function  $f(x) = \frac{1}{\sqrt{\log_{\frac{1}{3}}\left(\frac{x-1}{2-x}\right)}}$  is  $(a, b)$ , then  $2b =$

**Options:**

A.

$$a - 1$$

B.

$$a$$

C.

$$a + 1$$

D.

$$a + 2$$

**Answer: D**

**Solution:**

$$\text{Given, } f(x) = \frac{1}{\sqrt{\log_{1/3}\left(\frac{x-1}{2-x}\right)}}$$

$\therefore$  Domain

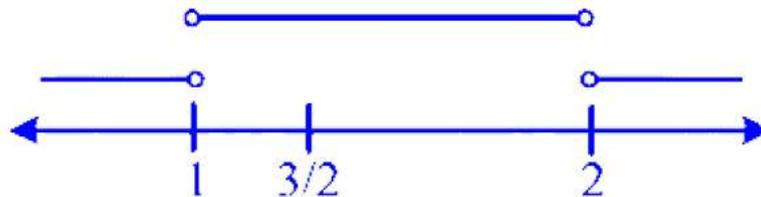

$$\log_{1/3} \frac{x-1}{2-x} > 0 \text{ and } \frac{x-1}{2-x} > 0$$

$$\Rightarrow \frac{x-1}{2-x} < \left(\frac{1}{3}\right)^0 \Rightarrow \frac{x-1}{2-x} < 1$$

$$\Rightarrow \frac{x-1}{2-x} - 1 < 0$$

$$\Rightarrow \frac{x-1-2+x}{2-x} < 0 \Rightarrow \frac{2x-3}{2-x} < 0$$

Now,

Now,  $x \in (1, \frac{3}{2})$

$$\therefore a = 1, b = \frac{3}{2}$$

$$\text{Now, } 2b = 3 = a + 2$$

### Question3

If  $\frac{1}{2 \cdot 7} + \frac{1}{7 \cdot 12} + \frac{1}{12 \cdot 17} + \frac{1}{17 \cdot 22} + \dots$  to 10 terms =  $k$ , then  $k =$

Options:

A.

$$\frac{2}{51}$$

B.

$$\frac{5}{51}$$

C.

$$\frac{5}{52}$$

D.

$$\frac{1}{26}$$

**Answer: C**

**Solution:**

Given,

$$\begin{aligned} & \frac{1}{2 \cdot 7} + \frac{1}{7 \cdot 12} + \frac{1}{12 \cdot 17} + \dots + 10 \text{ terms.} \\ &= \frac{1}{5} \left[ \frac{5}{2 \cdot 7} + \frac{5}{7 \cdot 12} + \frac{5}{12 \cdot 17} + \dots + 10 \text{ terms} \right] \\ &= \frac{1}{5} \left[ \frac{7-2}{2 \cdot 7} + \frac{12-7}{7 \cdot 12} + \frac{17-12}{12 \cdot 17} + \dots + 10 \text{ terms} \right] \\ &= \frac{1}{5} \left[ \frac{1}{2} - \frac{1}{7} + \frac{1}{7} - \frac{1}{12} + \left( \frac{1}{12} - \frac{1}{17} \right) + \dots \right] \\ &= \frac{1}{5} \left[ + \left( \frac{1}{2+9 \times 5} - \frac{1}{7+9 \times 5} \right) \right] \\ &= \frac{1}{5} \left( \frac{1}{2} - \frac{1}{52} \right) = \frac{1}{5} \left( \frac{25}{52} \right) = \frac{5}{52} \end{aligned}$$

---

## Question4

**If the system of simultaneous linear equations**

**$x + \lambda y - 2z = 1$ ,  $x - y + \lambda z = 2$  and  $x - 2y + 3z = 3$  is inconsistent for  $\lambda = \lambda_1$  and  $\lambda_2$ , then  $\lambda_1 + \lambda_2 =$**

**Options:**

A.

5

B.

$\sqrt{5}$

C.

1

D.

-1

**Answer: C**

**Solution:**

$$\text{Given, } x + \lambda y - 2z = 1$$

$$x - y + \lambda z = 2$$

$$\text{And } x - 2y + 3z = 3$$

∴ Given, system is inconsistent

$$D = 0 \Rightarrow \begin{vmatrix} 1 & \lambda & -2 \\ 1 & -1 & \lambda \\ 1 & -2 & 3 \end{vmatrix} = 0$$

$$\Rightarrow 1(-3 + 2\lambda) - \lambda(3 - \lambda) - 2(-2 + 1) = 0$$

$$\Rightarrow 2\lambda - 3 - 3\lambda + \lambda^2 + 2 = 0$$

$$\lambda^2 - \lambda - 1 = 0 \begin{matrix} \nearrow \lambda_1 \\ \searrow \lambda_2 \end{matrix}$$

$$\therefore \lambda_1 + \lambda_2 = 1$$

---

## Question5

The system of linear equation  $(\sin \theta)x + y - 2z = 0$ ,  
 $2x - y + (\cos \theta)z = 0$  and  $-3x + (\sec \theta)y + 3z = 0$ , where  
 $\theta \neq (2n + 1)\frac{\pi}{2}$ , has non-trivial solution for

**Options:**

A.

no value of  $\theta$

B.

$$\theta = n\pi + \frac{\pi}{4}, n \in Z$$

C.

$$\theta = \tan^{-1}\left(\frac{3}{4}\right)$$

D.

$$\theta = \tan^{-1}\left(\frac{4}{3}\right)$$

**Answer: A**

**Solution:**

Given,  $(\sin \theta)x + y - 2z = 0$

$$2x - y + (\cos \theta)z = 0$$

And  $-3x + (\sec \theta)y + 3z = 0$

∴ system has non-trivial solution.

$$\Delta = 0$$

$$\begin{vmatrix} \sin \theta & 1 & -2 \\ 2 & -1 & \cos \theta \\ -3 & \sec \theta & 3 \end{vmatrix} = 0$$

$$\sin \theta(-3 - 1) - 1(6 + 3 \cos \theta) - 2(2 \sec \theta - 3) = 0$$

$$\Rightarrow -4 \sin \theta - 6 - 3 \cos \theta - 4 \sec \theta + 6 = 0$$

$$\Rightarrow 4 \sec \theta + 3 \cos \theta + 4 \sin \theta = 0$$

$$\Rightarrow 4 + 3 \cos^2 \theta + 4 \sin \theta \cos \theta = 0$$

$$\Rightarrow 4 + 3 \left( \frac{1 + \cos 2\theta}{2} \right) + 2 \sin 2\theta = 0$$

$$\Rightarrow 8 + 3 + 3 \cos 2\theta + 4 \sin 2\theta = 0$$

$$\Rightarrow 11 + 3 \cos 2\theta + 4 \sin 2\theta = 0$$

This equation has no solution because the maximum value of  $4 \sin 2\theta + 3 \cos 2\theta$  is 5. Since  $5 + 11 \neq 0$ , there is no value of  $\theta$  that satisfies the equation.

---

## Question 6

If  $A = \begin{bmatrix} 1 & 2 \\ 3 & 4 \end{bmatrix}$ , then  $\text{adj}(\text{adj}(\text{adj} A))$

**Options:**

A.

A

B.

$A^{-1}$

C.

$|A|A^{-1}$

D.

$\frac{A^{-1}}{|A|}$

**Answer: C**

**Solution:**

$$A = \begin{bmatrix} 1 & 2 \\ 3 & 4 \end{bmatrix}$$

$$\therefore \text{adj}(\text{adj } A) = |A|^{n-2} A$$

$$\text{adj}(\text{adj}(\text{adj } A)) = |\text{adj } A|^{2-2} \cdot \text{adj } A$$

$$= \text{adj } A = |A| A^{-1} \left( \because A^{-1} = \frac{1}{|A|} \text{adj } A \right)$$

---

## Question 7

The sum of all the roots of the equation

$$\begin{vmatrix} x & -3 & 2 \\ -1 & -2 & (x-1) \\ 1 & (x-2) & 3 \end{vmatrix} = 0 \text{ is}$$

Options:

A.

13

B.

3

C.

2

D.

7

**Answer: B**

**Solution:**

Given,

$$\begin{vmatrix} x & -3 & 2 \\ -1 & -2 & x-1 \\ 1 & x-2 & 3 \end{vmatrix} = 0$$

$$\Rightarrow x(-6 - (x-1)(x-2)) + 3(-3 - (x-1)) + 2(-(x-2) + 2) = 0$$

$$\Rightarrow x(-6 - x^2 + 3x - 2) + 3(-3 - x + 1) + 2(-x + 2 + 2) = 0$$

$$\Rightarrow x(-x^2 + 3x - 8) + 3(-2 - x) + 2(4 - x) = 0$$

$$\Rightarrow -x^3 + 3x^2 - 8x - 6 - 3x + 8 - 2x = 0$$

$$\therefore \text{Sum of roots} = \frac{-3}{-1} = 3.$$

## Question 8

One of the values of  $\sqrt{24 - 70i} + \sqrt{-24 + 70i}$  is

Options:

A.

$$2 + 12i$$

B.

$$12 - 2i$$

C.

$$-12 + 2i$$

D.

$$-12 - 2i$$

**Answer: D**

**Solution:**

We have,

$$z = \sqrt{24 - 70i} + \sqrt{-24 + 70i}$$

$$z^2 = 24 - 70i + (-24 + 70i)$$

$$+ 2\sqrt{24 - 70i}\sqrt{-24 + 70i}$$

$$= 2i(24 - 70i) = 2(24i + 70)$$

$$= 4(12i + 35)$$

$$z = \sqrt{4}\sqrt{35 + 12i}$$

$$= 2 \left( \pm \left( \frac{\operatorname{Re} z + |z|}{2} \right)^{1/2} \right)$$

$$+ i \left( \frac{-\operatorname{Re} z + |z|}{2} \right)^{1/2} \right)$$

$$= \pm 2 \left( \left( \frac{35 + 37}{2} \right)^{1/2} + i \left( \frac{-35 + 37}{2} \right)^{1/2} \right)$$

$$= \pm 2(6 + i) = \pm(12 \pm 2i)$$

## Question9

The set of all values of  $\theta$  such that  $\frac{1-i \cos \theta}{1+2i \sin \theta}$  is purely imaginary is

Options:

A.

$$\{n\pi + (-1)^n \frac{\pi}{4}, n \in \mathbb{Z}\}$$

B.

$$\{\frac{n\pi}{2} + (-1)^n \frac{\pi}{4}, n \in \mathbb{Z}\}$$

C.

$$\{n\pi + (-1)^n \frac{\pi}{2}, n \in \mathbb{Z}\}$$

D.

$$\{2n\pi \pm \frac{\pi}{4}, n \in \mathbb{Z}\}$$

**Answer: B**

**Solution:**

$z = \frac{1-i \cos \theta}{1+2i \sin \theta}$  is purely imaginary

$$\therefore z + \bar{z} = 0$$

$$\Rightarrow \frac{1-i \cos \theta}{1+2i \sin \theta} + \frac{1+i \cos \theta}{1-2i \sin \theta} = 0$$

$$\frac{1-2i \sin \theta - i \cos \theta - 2 \sin \theta \cos \theta + 1 + i \cos \theta + 2i \sin \theta - 2 \sin \theta \cos \theta}{(1+2i \sin \theta)(1-2i \sin \theta)} = 0$$

$$\Rightarrow (2-4 \sin \theta \cos \theta) = 0$$

$$\Rightarrow 2 \sin 2\theta = 2 \Rightarrow \sin 2\theta = 1$$

$$\Rightarrow \sin 2\theta = \sin \frac{\pi}{2}$$

$$\therefore 2\theta = n\pi + (-1)^n \frac{\pi}{2}, n \in \mathbb{Z}$$

$$\therefore \theta = \frac{n\pi}{2} + (-1)^n \frac{\pi}{4}, n \in \mathbb{Z}.$$

---

## Question10

If  $\cos \alpha + \cos \beta + \cos \gamma = 0 = \sin \alpha + \sin \beta + \sin \gamma$ , then  
 $\sin 2\alpha + \sin 2\beta + \sin 2\gamma =$

**Options:**

A.

$$\cos(\alpha + \beta) + \cos(\beta + \gamma) + \cos(\gamma + \alpha)$$

B.

$$\cos^2 \alpha + \cos^2 \beta + \cos^2 \gamma$$

C.

$$\sin^2 \alpha + \sin^2 \beta + \sin^2 \gamma$$

D.

$$\cos(2\alpha - \beta - \gamma) + \cos(2\beta - \gamma - \alpha) + \cos(2\gamma - \alpha - \beta)$$

**Answer: A**

**Solution:**

We have

$$\begin{aligned}\cos \alpha + \cos \beta + \cos \gamma &= 0 \\ &= \sin \alpha + \sin \beta + \sin \gamma\end{aligned}$$

$$\text{Let } a = \cos \alpha + i \sin \alpha$$

$$b = \cos \beta + i \sin \beta$$

$$c = \cos \gamma + i \sin \gamma$$

$$\begin{aligned}\therefore a + b + c &= (\cos \alpha + \cos \beta + \cos \gamma) \\ &\quad + i(\sin \alpha + \sin \beta + \sin \gamma)\end{aligned}$$

$$a + b + c = 0$$

$$\text{and } a^{-1} + b^{-1} + c^{-1} = 0$$

$$\begin{aligned}\therefore ab + bc + ca &= 0 \\ \Rightarrow \cos(\alpha + \beta) + \cos(\beta + \gamma) \\ &\quad + \cos(\gamma + \alpha) = 0\end{aligned}$$

$$\text{Now } a^2 + b^2 + c^2 = (a + b + c)^2$$

$$-2(ab + bc + ca)$$

$$\therefore \sin 2\alpha + \sin 2\beta + \sin 2\gamma = 0$$

---

## Question11

If  $\alpha$  is a root of the equation  $x^2 - x + 1 = 0$ , then

$(\alpha + \frac{1}{\alpha})^3 + (\alpha^2 + \frac{1}{\alpha^2})^3 + (\alpha^3 + \frac{1}{\alpha^3})^3 + (\alpha^4 + \frac{1}{\alpha^4})^3 + \dots$  to 12 terms =

Options:

A.

-32

B.

32

C.

0

D.

16

**Answer: C**

**Solution:**

$$x^2 - x + 1 = 0 \rightarrow \alpha$$

$$\therefore \alpha = -\omega \Rightarrow \alpha^3 = -\omega^3 = -1$$

Now,  $(\alpha + \frac{1}{\alpha})^3 + (\alpha^2 + \frac{1}{\alpha^2})^3 + \dots$  to 12 terms

$$= \left(\frac{\alpha^2+1}{\alpha}\right)^3 + \left(\frac{\alpha^4+1}{\alpha^2}\right)^3 + (-1-1)^3 + \dots + 12 \text{ terms}$$

$$= [(1)^3 + (1)^3 + (-2)^3 + (-1)^3 + (-1)^3 + (2)^3]2 = 0$$

---

## Question12

If the equations  $x^2 + px + 2 = 0$  and  $x^2 + x + 2p = 0$  have a common root, then the sum of the roots of the equation  $x^2 + 2px + 8 = 0$  is

Options:

A.

-3

B.

3

C.

6

D.

-6

**Answer: C**

**Solution:**

$$x^2 + px + 2 = 0$$

$$x^2 + x + 2p = 0$$

Let ' $\alpha$ ' be the common root

$$a^2 + pa + 2 = 0$$

$$a^2 + a + 2p = 0$$

$$\begin{array}{r} - \quad - \quad - \quad - \\ \hline \end{array}$$

$$a(p - 1) + 2 - 2p = 0$$

$$\therefore \alpha = 2$$

$$4 + 2p + 2 = 0$$

$$2p = -6$$

$$p = -3$$

$\therefore$  Sum of roots of  $x^2 + 2px + 8 = 0$  (i.e.,  $x^2 - 6x + 8 = 0$ ) is 6 .

---

## Question13

**If both roots of the equation  $x^2 - 5ax + 6a = 0$  exceed 1 , then the range of ' a ' is**

**Options:**

A.

$$[-1, 0) \cup \left[\frac{24}{25}, \infty\right)$$

B.

$$\left[\frac{24}{25}, \infty\right)$$

C.

$$[-1, 0)$$

D.

$R$

**Answer: B**

**Solution:**

$$x^2 - 5ax + 6a = 0$$

∴ Both roots are greater than 2 .

$$D \geq 0, \frac{-b}{2a} > 1, f(0) > 0$$

$$(5a)^2 - 4(1)(6a) \geq 0, \frac{5a}{2} > 1, 6a > 0$$

$$\Rightarrow a(25a - 24) \geq 0, a > \frac{2}{5}, a > 0$$

$$\therefore a \in \left[\frac{24}{25}, \infty\right)$$

---

## Question14

**If  $\alpha, \beta, \gamma$  and  $\delta$  are the roots of the equation**

**$x^4 - 4x^3 + 3x^2 + 2x - 2 = 0$  such that  $\alpha$  and  $\beta$  are integers and  $\gamma, \delta$  are irrational numbers, then  $\alpha + 2\beta + \gamma^2 + \delta^2 =$**

**Options:**

A.

5

B.

7

C.

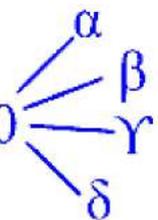

11

D.

13

**Answer: C**

**Solution:**

$$x^4 - 4x^3 + 3x^2 + 2x - 2 = 0$$

$$\Rightarrow x^3(x-1) - 3x^2(x-1) + 2(x-1) = 0$$

$$\Rightarrow (x-1)(x^3 - 3x^2 + 2) = 0$$

$$\Rightarrow (x-1)[x^2(x-1) - 2x(x-1) - 2(x-1)] = 0$$

$$\Rightarrow (x-1)(x-1)(x^2 - 2x - 2) = 0$$

$$\therefore \alpha = 1, \gamma + \delta = 2$$

$$\beta = 1, \gamma\delta = -2$$

$$\therefore \alpha + 2\beta + \gamma^2 + \delta^2$$

$$= 1 + 2 + (\gamma + \delta)^2 - 2\gamma\delta$$

$$= 3 + 4 + 4 = 11$$

---

## Question15

**The equation having the multiple root of the equation  $x^4 + 4x^3 - 16x - 16 = 0$  as its roots is**

**Options:**

A.

$$x^2 + 2x - 3 = 0$$

B.

$$x^2 - 3x + 2 = 0$$

C.

$$x^2 + x - 2 = 0$$

D.

$$x^2 - 4x + 3 = 0$$

**Answer: C**

**Solution:**

We have,  $x^4 + 4x^3 - 16x - 16 = 0$

$$\Rightarrow x^3(x - 2) + 6x^2(x - 2) + 12x(x - 2) + 8(x - 2) = 0$$

$$\Rightarrow (x - 2)(x^3 + 6x^2 + 12x + 8) = 0$$

$$\Rightarrow (x - 2)[x^2(x + 2) + 4x(x + 2) + 4(x + 2)] = 0$$

$$\Rightarrow (x - 2)(x + 2)(x^2 + 4x + 4) = 0$$

$$\Rightarrow (x - 2)(x + 2)^3 = 0$$

$\therefore$  Multiply roots is -2 .

(a)  $x^2 + 2x - 3 = 0 \Rightarrow (x + 3)(x - 1) = 0$

(b)  $x^2 - 3x + 2 = 0 \Rightarrow (x - 2)(x - 1) = 0$

(c)  $x^2 + x - 2 = 0 \Rightarrow (x + 2)(x - 1) = 0$

(d)  $x^2 - 4x + 3 = 0 \Rightarrow (x - 3)(x - 1) = 0$

---

## Question16

**There are 15 stations on a train route and the train has to be stopped at exactly 5 stations among these 15 stations. If it stops at atleast two consecutive stations, then the number of ways in which the train can be stopped is**

**Options:**

A.

$${}^{11}C_5$$

B.

$${}^{15}C_5$$

C.

$${}^{15}C_5 - {}^{11}C_5$$

D.

$${}^{15}C_{10} - {}^9C_5$$

**Answer: C**

**Solution:**

$\therefore$  Total number of ways in which train has stopped at exactly 5 stations  $= {}^{15}C_5$

And total number of ways in which train has not stopped in consecutive stations

$$x_1 + x_2 + x_3 + x_4 + x_5 + L = 15 - 4 = 11$$

$x_i$  = number of station left before  $i^{\text{th}}$  station

$x_1 \geq 0, x_2, x_3, x_4, x_5 \geq 1$ , and  $L$  = station

left after 4 stations

$$\begin{aligned} x_1 + (x_2 - 1) + (x_3 - 1) + (x_4 - 1) + (x_5 - 1) + L \\ = 11 - 4 = 7 \end{aligned}$$

$$\begin{aligned} \therefore \text{Total number of solution} &= {}^{7+5-1}C_{6-1} \\ &= {}^{11}C_5 \end{aligned}$$

$$\therefore \text{Required ways} = {}^{15}C_5 - {}^{11}C_5$$

---

## Question17

**Number of all possible ways of distributing eight identical apples among three persons is**

**Options:**

A.

45

B.

42

C.

39

D.

36

**Answer: A**

**Solution:**

Number of all possible ways of distributing eight identical apples among 3 persons is number of non-negative integral solution of equation is

$$\begin{aligned}x + y + z &= 8 \\ \therefore {}^{8+3-1}C_{3-1} \\ &= {}^{10}C_2 \\ &= \frac{10 \times 9}{2 \times 1} = 45\end{aligned}$$

---

## Question18

**Number of all possible words (with or without meaning) that can be formed using all the letters of the word CABINET in which neither the word CAB nor the word NET appear is**

**Options:**

A.

5040

B.

4806

C.

4800

D.

5034

**Answer: B**

**Solution:**

The number of word in which  
“CAB” appear is CAB I N E T = 5!

The number of word in which  
“NET” appear is NET C A B T = 5!

The number of words in CAB and NET both appears = CAB NET  $I = 3!$

$\therefore$  Required number of ways

$$\begin{aligned} &= 7! - (5! + 5! - 3!) \\ &= 5040 - (120 + 120 - 6) \\ &= 5040 - 234 \\ &= 4806 \end{aligned}$$

---

## Question19

**Numerically greatest term in the expansion of  $(2x - 3y)^n$  when  $x = \frac{7}{2}$ ,  $y = \frac{3}{7}$  and  $n = 13$  is**

**Options:**

A.

$$13 \cdot 3^5 \cdot 7^9$$

B.

$$13 \cdot 3^4 \cdot 7^9$$

C.

$$26 \cdot 3^5 \cdot 7^9$$

D.

$$26 \cdot 3^4 \cdot 7^9$$

**Answer: C**

**Solution:**

For numerically greatest term in the expansion of  $(2x - 3y)^n$

$$\begin{aligned} r &= \frac{n+1}{1 + \left| \frac{2x}{3y} \right|} = \frac{13+1}{1 + \left| \frac{2 \times \frac{7}{2}}{3 \times \frac{3}{7}} \right|} = \frac{14}{1 + \frac{49}{9}} \\ &= \frac{14 \times 9}{9 + 49} = \frac{126}{58} \end{aligned}$$

$$\therefore [r] = 2$$

$\therefore T_3$  will be numerically greatest term

$$\begin{aligned}
\therefore T_3 &= {}^{13}C_2(2x)^{11}(-3y)^2 \\
&= \frac{13 \times 12}{2} \times \left(2 \times \frac{7}{2}\right)^{11} \left(-3 \times \frac{3}{7}\right)^2 \\
&= 13 \times 6 \times 7^{11} \times \frac{3^4}{7^2} \\
&= 263^5 7^9
\end{aligned}$$

---

## Question20

If  $C_0, C_1, C_2, \dots, C_8$  are the binomial coefficients in the expansion of

$$(1 + x)^8, \text{ then } \sum_{r=1}^8 r^3 \frac{C_r}{C_{r-1}} =$$

**Options:**

A.

540

B.

336

C.

105

D.

270

**Answer: A**

**Solution:**

$$\begin{aligned}
\sum_{r=1}^8 r^3 \cdot \frac{C_r}{C_{r-1}} &= \sum_{r=1}^8 r^3 \cdot \frac{8-r+1}{r} \\
&= \sum_{r=1}^8 (9r^2 - r^3) \left[ \because \frac{{}^n C_r}{{}^n C_{r-1}} = \frac{n-r+1}{r} \right] \\
&= 9 \left( \frac{8}{6} (8+1)(17) \right) - \left( \frac{8}{2} \times 9 \right)^2 \\
&= 3 \times 4 \times 9 \times 17 - 4 \times 4 \times 9 \times 9 \\
&= 4 \times 9(51 - 36) = 36 \times 15 = 540
\end{aligned}$$

# Question21

If  $\frac{x+3}{(x+1)(x^2+2)} = \frac{a}{x+1} + \frac{bx+c}{x^2+2}$ , then  $a - b + c =$

Options:

A.

0

B.

1

C.

3

D.

2

**Answer: C**

**Solution:**

$$\frac{x+3}{(x+1)(x^2+2)} = \frac{a}{x+1} + \frac{bx+c}{x^2+2}$$

$$\Rightarrow x+3 = a(x^2+2) + (bx+c)(x+1)$$

put  $x = -1$

$$2 = a(3) \Rightarrow a = \frac{2}{3}$$

put  $x = 0$

$$3 = 2a + c$$

$$c = 3 - \frac{4}{3} = \frac{5}{3}$$

put  $x = 1$

$$4 = 3a + (b+c)2$$

$$4 = 2 + \left(b + \frac{5}{3}\right)2$$

$$1 = b + \frac{5}{3} \Rightarrow b = \frac{-2}{3}$$

$$\therefore a - b + c = \frac{2}{3} + \frac{2}{3} + \frac{5}{3} = \frac{9}{3} = 3$$

---

## Question22

If  $3 \sin \theta + 4 \cos \theta = 3$  and  $\theta \neq (2n + 1) \frac{\pi}{2}$ , then  $\sin 2\theta =$

Options:

A.

$$\frac{336}{625}$$

B.

$$-\frac{7}{25}$$

C.

$$\frac{24}{25}$$

D.

$$-\frac{336}{625}$$

**Answer: D**

**Solution:**

$$3 \sin \theta + 4 \cos \theta = 3$$

$$\text{On squaring both sides, we get } 79 \sin^2 \theta + 16 \cos^2 \theta + 24 \sin \theta \cos \theta = 9$$

$$\Rightarrow 9 + 7 \cos^2 \theta + 24 \sin \theta \cos \theta = 9$$

$$\Rightarrow \cos \theta (7 \cos \theta + 24 \sin \theta) = 0$$

$$\Rightarrow \cos \theta \neq 0$$

$$\theta \neq (2n + 1) \frac{\pi}{2}$$

$$\text{and } 7 \cos \theta + 24 \sin \theta = 0$$

$$\tan \theta = \frac{-7}{24}$$

$$\therefore \sin 2\theta = \frac{2 \tan \theta}{1 + \tan^2 \theta}$$

$$= \frac{2 \times \left(\frac{-7}{24}\right)}{1 + \frac{49}{576}} = \frac{-14 \times 24}{625}$$

$$= \frac{-336}{625}$$

---

## Question23

$$\frac{\cos 15^\circ \cos^2 22\frac{1}{2}^\circ - \sin 75^\circ \sin^2 52\frac{1}{2}^\circ}{\cos^2 15^\circ - \cos^2 75^\circ}$$

Options:

A.

1

B.

$\frac{1}{2}$

C.

$\frac{1}{4}$

D.

$\frac{1}{8}$

Answer: C

Solution:

$$\begin{aligned} & \frac{\cos 15^\circ \cos^2 22\frac{1}{2}^\circ - \sin 75^\circ \sin^2 52\frac{1}{2}^\circ}{\cos^2 15^\circ - \cos^2 75^\circ} \\ &= \frac{\cos 15^\circ (\cos^2 22\frac{1}{2}^\circ - \sin^2 52\frac{1}{2}^\circ)}{\cos^2 15^\circ - \sin^2 15^\circ} \left( \begin{array}{l} \because \sin 75^\circ = \sin(90^\circ - 15^\circ) \\ = \cos 15^\circ \end{array} \right) \\ &= \frac{\cos 15^\circ \left( \frac{1 + \cos 45^\circ}{2} - \frac{1 - \cos 105^\circ}{2} \right)}{\cos 30^\circ} \\ &= \frac{\cos 15^\circ [\cos 45^\circ + \cos(90 + 15^\circ)]}{2 \cdot \frac{\sqrt{3}}{2}} \\ &= \frac{1}{\sqrt{3}} (\cos 15^\circ \cos 45^\circ - \sin 15^\circ \cos 15^\circ) \\ &= \frac{1}{2\sqrt{3}} (2 \cos 15^\circ \cos 45^\circ - 2 \cos 15^\circ \sin 15^\circ) \\ &= \frac{1}{2\sqrt{3}} [\cos(60^\circ) + \cos 30^\circ - \sin 30^\circ] \\ &= \frac{1}{2\sqrt{3}} \left( \frac{\sqrt{3}}{2} \right) = \frac{1}{4} \end{aligned}$$

---

## Question24

$$16 \sin 12^\circ \cos 18^\circ \sin 48^\circ =$$

**Options:**

A.

$$\sqrt{10 - 2\sqrt{5}}$$

B.

$$\sqrt{10 + 2\sqrt{5}}$$

C.

$$\sqrt{5} - 1$$

D.

$$\sqrt{5} + 1$$

**Answer: A**

**Solution:**

$$\begin{aligned} &16 \sin 12^\circ \cos 18^\circ \sin 48^\circ \\ &= 16 \sin 12^\circ \sin 72^\circ \sin 48^\circ \\ &= 16 \sin 12^\circ \sin (60 + 12^\circ) \sin (60^\circ - 12^\circ) \\ &= \frac{16}{4} \sin 3(12^\circ) = 4 \sin 36^\circ \\ &= \frac{4\sqrt{10 - 2\sqrt{5}}}{4} = \sqrt{10 - 2\sqrt{5}} \end{aligned}$$

---

## Question25

**Number of solutions of the equation**

$\sin^2 \theta + 2 \cos^2 \theta - \sqrt{3} \sin \theta \cos \theta = 2$  lying in the interval  $(-\pi, \pi)$  is

**Options:**

A.

2

B.

3

C.

4

D.

5

**Answer: B**

**Solution:**

$$\sin^2 \theta + 2 \cos^2 \theta - \sqrt{3} \sin \theta \cos \theta = 2$$

$$\Rightarrow 1 + \cos^2 \theta - \sqrt{3} \sin \theta \cos \theta = 2$$

$$\Rightarrow 1 + \cos 2\theta - \sqrt{3} \sin 2\theta - 2 = 0$$

$$\Rightarrow \cos 2\theta - \sqrt{3} \sin 2\theta = 1$$

Divide by  $\sqrt{1^2 + (-\sqrt{3})^2} = \sqrt{4} = 2$  on both sides

$$\Rightarrow \frac{1}{2} \cos 2\theta - \frac{\sqrt{3}}{2} \sin 2\theta = \frac{1}{2}$$

$$\Rightarrow \cos \left( 2\theta + \frac{\pi}{3} \right) = \frac{1}{2}$$

$$\Rightarrow 2\theta + \frac{\pi}{3} = 2n\pi \pm \frac{\pi}{3}, n \in \mathbb{Z}$$

$$\text{If } 2\theta + \frac{\pi}{3} = 2n\pi + \frac{\pi}{3} \Rightarrow \theta = n\pi, n \in \mathbb{Z}$$

$$\text{If } 2\theta + \frac{\pi}{3} = 2n\pi - \frac{\pi}{3} \Rightarrow \theta = n\pi - \frac{\pi}{3}, n \in \mathbb{Z}$$

For  $\theta = n\pi$ , if  $n = 0$ ,  $\theta = 0 \in (-\pi, \pi)$

For  $\theta = n\pi - \frac{\pi}{3}$ , if  $n = 0$ ,  $\theta = -\frac{\pi}{3} \in (-\pi, \pi)$

if  $n = 1$ ,  $\theta = \pi - \frac{\pi}{3} = \frac{2\pi}{3} \in (-\pi, \pi)$

$\therefore$  Solutions are  $0, -\frac{\pi}{3}, \frac{2\pi}{3}$

$\Rightarrow$  Number of solutions = 3

---

## Question 26

If  $0 \leq x < \frac{3}{4}$ , then the number of values of  $x$  satisfying the equation  $\tan^{-1}(2x - 1) + \tan^{-1} 2x = \tan^{-1} 4x - \tan^{-1}(2x + 1)$  is

**Options:**

A.

0

B.

1

C.

2

D.

3

**Answer: B**

**Solution:**

$$\begin{aligned} & \tan^{-1}(2x - 1) + \tan^{-1} 2x \\ & \quad = \tan^{-1} 4x - \tan^{-1}(2x + 1) \\ \Rightarrow & \tan^{-1}(2x - 1) + \tan^{-1}(2x + 1) \\ & \quad = \tan^{-1} 4x - \tan^{-1} 2x \\ \Rightarrow & \tan^{-1} \left( \frac{2x - 1 + 2x + 1}{1 - (2x - 1)(2x + 1)} \right) \\ = & \tan^{-1} \left( \frac{4x - 2x}{1 + (4x)(2x)} \right) \\ \Rightarrow & \tan^{-1} \left( \frac{4x}{1 - 4x^2 + 1} \right) = \tan^{-1} \left( \frac{2x}{1 + 8x^2} \right) \\ \therefore & \frac{4x}{2 - 4x^2} = \frac{2x}{1 + 8x^2} \\ & x = 0 \\ & 1 - x^2 = 1 + 8x^2 \\ & x^2 = 0 \Rightarrow x = 0 \\ \therefore & \text{Only one solution.} \end{aligned}$$

---

## Question27

If  $\sinh^{-1} x = \cosh^{-1} y = \log(1 + \sqrt{2})$ , then  $\tan^{-1}(x + y)$

**Options:**

A.

$67\frac{1}{2}^\circ$

B.

75°

C.

22½°

D.

15°

**Answer: A**

**Solution:**

$$\sinh^{-1} x = \cosh^{-1} y = \log(1 + \sqrt{2})$$

$$\sinh^{-1} x = \log(1 + \sqrt{2})$$

$$\log(x + \sqrt{x^2 + 1}) = \log(1 + \sqrt{2})$$

$$x = 1$$

$$\text{And } \cosh^{-1} y = \log(1 + \sqrt{2})$$

$$\Rightarrow \log(y + \sqrt{y^2 - 1}) = \log(1 + \sqrt{2})$$

$$\therefore y = \sqrt{2}$$

$$\text{Now, } \tan^{-1}(x + y)$$

$$= \tan^{-1}(1 + \sqrt{2})$$

$$= 67.5^\circ$$

---

## Question28

**In a  $\triangle ABC$ , if  $c^2 - a^2 = b(\sqrt{3}c - b)$  and  $b^2 - a^2 = c(c - a)$  then,  $\angle ABC$**

**Options:**

A.

30°

B.

60°

C.

45°

D.

90°

**Answer: D**

**Solution:**

$$c^2 - a^2 = \sqrt{3}bc - b^2$$
$$\frac{b^2 + c^2 - a^2}{2bc} = \frac{\sqrt{3}bc}{2bc}$$

$$\cos A = \frac{\sqrt{3}}{2}$$

$$\Rightarrow A = 30^\circ$$

$$b^2 - a^2 = c^2 - ac$$

$$c^2 + a^2 - b^2 = ac$$

$$\frac{c^2 + a^2 - b^2}{2ac} = \frac{1}{2}$$

$$\cos B = \frac{1}{2}$$

$$\Rightarrow B = 60^\circ$$

$$\therefore \angle A + \angle B + \angle C = 180^\circ$$

$$\angle C = 180^\circ - 30^\circ - 60^\circ = 90^\circ$$

---

## Question29

Let  $ABC$  be a triangle right angled at  $B$ . If  $a = 13$  and  $c = 84$ , then  $r + R =$

**Options:**

A.

42.5

B.

169

C.

98

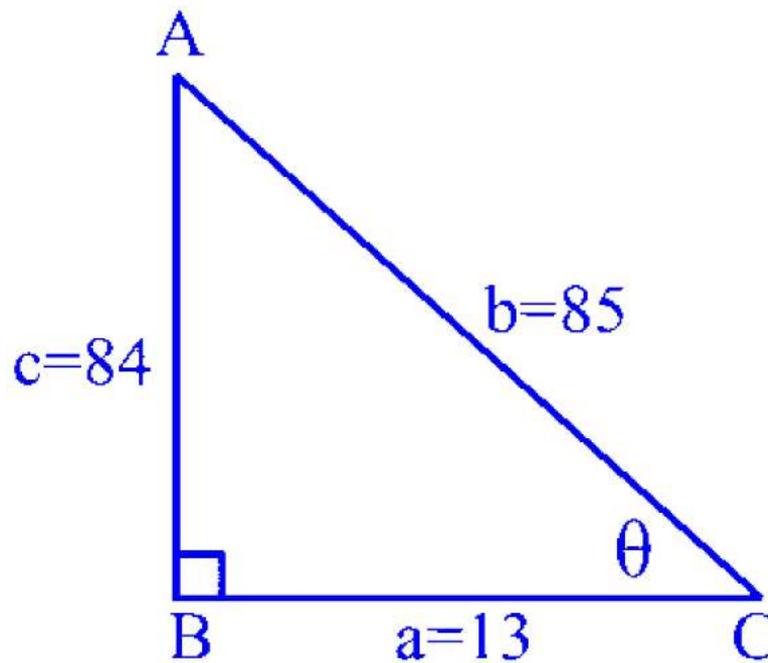

D.

48.5

**Answer: D**

## Solution:

Given,  $\angle B = 90^\circ$ ,  $a = 13$ ,  $c = 84$

$$b^2 = a^2 + c^2$$

$$b^2 = 7225$$

$$b = 85$$

$$\begin{aligned}\therefore r &= \frac{\Delta}{s} \\ &= \frac{\frac{1}{2} \times 13 \times 84}{\frac{13+84+85}{2}} \\ &= \frac{13 \times 84}{182} \\ &= \frac{13 \times 6}{13} = 6\end{aligned}$$

$$R = \frac{b}{2} = \frac{85}{2} = 42.5$$

$$\therefore r + R = 6 + 42.5 = 48.5$$

---

## Question30

If  $\mathbf{a} = (x + 2y - 3)\hat{\mathbf{i}} + (2x - y + 3)\hat{\mathbf{j}}$  and

$\mathbf{b} = (3x - 2y)\hat{\mathbf{i}} + (x - y + 1)\hat{\mathbf{j}}$  are two vectors such that  $\mathbf{a} = 2\mathbf{b}$ , then  $y - 5x =$

Options:

A.

10

B.

-10

C.

8

D.

-8

**Answer: C**

**Solution:**

Given,

$$\mathbf{a} = (x + 2y - 3)\hat{\mathbf{i}} + (2x - y + 3)\hat{\mathbf{j}}$$

$$\mathbf{b} = (3x - 2y)\hat{\mathbf{i}} + (x - y + 1)\hat{\mathbf{j}}$$

$$\therefore \mathbf{a} = 2\mathbf{b}$$

$$\therefore x + 2y - 3 = 2(3x - 2y)$$

$$x + 2y - 3 = 6x - 4y$$

$$5x - 6y + 3 = 0 \quad \dots (i)$$

$$\text{And } 2x - y + 3 = 2(x - y + 1)$$

$$2x - y + 3 = 2x - 2y + 2$$

$$y = -1 \quad (\text{Using Eq. (i)})$$

$$\therefore x = \frac{-9}{5}$$

$$\therefore y - 5x$$

$$= -1 + 9 = 8$$

---

## Question31

$7\hat{\mathbf{i}} - 4\hat{\mathbf{j}} + 7\hat{\mathbf{k}}, \hat{\mathbf{i}} - 6\hat{\mathbf{j}} + 10\hat{\mathbf{k}}, -\hat{\mathbf{i}} - 3\hat{\mathbf{j}} + 4\hat{\mathbf{k}}, 5\hat{\mathbf{i}} - \hat{\mathbf{j}} + \hat{\mathbf{k}}$  are the position vectors of the points  $A, B, C$  and  $D$  respectively. If  $p\hat{\mathbf{i}} + q\hat{\mathbf{j}} + r\hat{\mathbf{k}}$  is the position vector of the point of intersection of the diagonals of the quadrilateral  $ABCD$ , then  $p + q + r =$

**Options:**

A.

4

B.

5

C.

0

D.

1

**Answer: B**

**Solution:**

Position vectors of  $A, B, C$  and  $D$  are

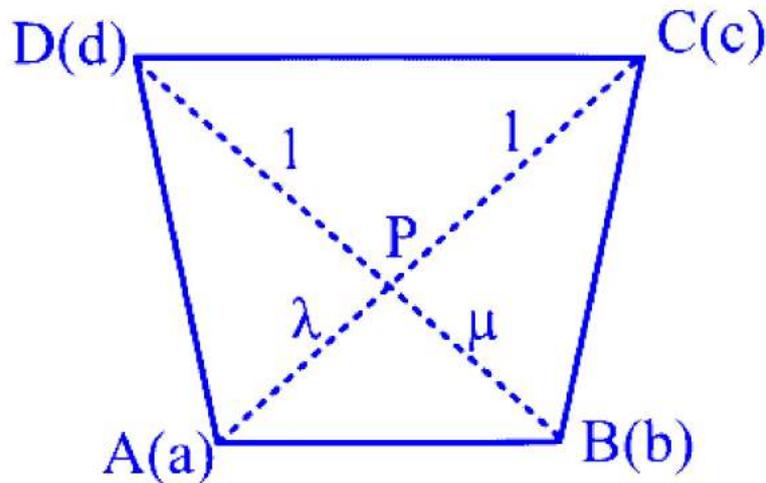

$$\mathbf{a} = 7\hat{\mathbf{i}} - 4\hat{\mathbf{j}} + 7\hat{\mathbf{k}}$$

$$\mathbf{b} = \hat{\mathbf{i}} - 6\hat{\mathbf{j}} + 10\hat{\mathbf{k}}$$

$$\mathbf{c} = -\hat{\mathbf{i}} - 3\hat{\mathbf{j}} + 4\hat{\mathbf{k}}$$

$$\mathbf{d} = 5\hat{\mathbf{i}} - \hat{\mathbf{j}} + \hat{\mathbf{k}} \text{ respectively.}$$

$\therefore$  Let point of intersection of  $\mathbf{AC}$  and  $\mathbf{BD}$  be  $P$

$\therefore$  Position of vector of  $P$  is  $\left(\frac{\lambda\mathbf{c} + \mathbf{a}}{\lambda + 1}\right)$  or

$$\frac{\mu\mathbf{d} + \mathbf{b}}{\mu + 1}$$

$$\therefore \frac{-\lambda\hat{\mathbf{i}} - 3\lambda\hat{\mathbf{j}} + 4\lambda\hat{\mathbf{k}} + 7\hat{\mathbf{i}} - 4\hat{\mathbf{j}} + 7\hat{\mathbf{k}}}{\lambda + 1}$$

$$= \frac{5\mu\hat{\mathbf{i}} - \mu\hat{\mathbf{j}} + \mu\hat{\mathbf{k}} + \hat{\mathbf{i}} - 6\hat{\mathbf{j}} + 10\hat{\mathbf{k}}}{\mu + 1}$$

$$\frac{-\lambda + 7}{\lambda + 1} = \frac{5\mu + 1}{\mu + 1}$$

$$\Rightarrow -\lambda\mu + 7\mu - \lambda + 7 = 5\lambda\mu + \lambda + 5\mu + 1$$

$$6\lambda\mu + 2\lambda - 2\mu = 6$$

$$3\lambda\mu + \lambda - \mu = 3 \quad \dots (i)$$

$$\frac{-3\lambda - 4}{\lambda + 1} = \frac{-\mu - 6}{\mu + 1}$$

$$\Rightarrow -3\lambda\mu - 4\mu - 3\lambda - 4 = -\lambda\mu - 6\lambda - \mu - 6$$

$$2\lambda\mu - 3\lambda + 3\mu = 2 \quad \dots (ii)$$

$$\frac{4\lambda + 7}{\lambda + 1} = \frac{\mu + 10}{\mu + 1}$$

$$\Rightarrow 4\lambda\mu + 7 + 7\mu + 4\lambda = \lambda\mu + 10\lambda + \mu + 10$$

$$3\lambda\mu - 6\lambda + 6\mu = 3$$

$$\lambda\mu - 2\lambda + 2\mu = 1 \quad \dots (iii)$$

$$\lambda(\mu - 2) = 1 - 2\mu$$

$$\lambda = \frac{1 - 2\mu}{\mu - 2}$$

By Eq. (i)

$$3\mu \left( \frac{1 - 2\mu}{\mu - 2} \right) + \frac{1 - 2\mu}{\mu - 2} - \mu = 3$$

$$\Rightarrow 3\mu - 6\mu^2 + 1 - 2\mu - \mu^2 + 2\mu = 3\mu - 6$$

$$\Rightarrow \mu = \pm 1$$

$$\text{If } \mu = 1, \quad \lambda = 1 \text{ and } \mu = -1, \quad \lambda = -1$$

$\therefore$  Position vector of

$$P = \frac{(-\lambda + 7)\hat{i} + (-3\lambda - 4)\hat{j} + (4\lambda + 7)\hat{k}}{\lambda + 1}$$

$$\begin{aligned} \therefore p + q + r &= \frac{-\lambda + 7 - 3\lambda - 4 + 4\lambda + 7}{\lambda + 1} \\ &= \frac{10}{\lambda + 1} = 5 \text{ (At } \lambda = 1) \end{aligned}$$

## Question32

If  $\mathbf{a} = \hat{i} + \sqrt{11}\hat{j} - 2\hat{k}$  and  $\mathbf{b} = \hat{i} + \sqrt{11}\hat{j} - 10\hat{k}$  are two vectors, then the component of  $\mathbf{b}$  perpendicular to  $\mathbf{a}$  is

Options:

A.

$$3\hat{i} - \sqrt{11}\hat{j} - 4\hat{k}$$

B.

$$\hat{i} - \sqrt{11}\hat{j} - 5\hat{k}$$

C.

$$-(\hat{i} + \sqrt{11}\hat{j} + 6\hat{k})$$

D.

$$-5\hat{i} + \sqrt{11}\hat{j} + 3\hat{k}$$

**Answer: C**

**Solution:**

$$\text{Given, } \mathbf{a} = \hat{i} + \sqrt{11}\hat{j} - 2\hat{k},$$

$$\mathbf{b} = \hat{i} + \sqrt{11}\hat{j} - 10\hat{k}$$

$\therefore$  component of  $\mathbf{b}$  perpendicular to  $\mathbf{a}$  is

$$\mathbf{b} - (\mathbf{a} \cdot \mathbf{b})\hat{\mathbf{a}}$$

$$= (\hat{i} + \sqrt{11}\hat{j} - 10\hat{k})$$

$$- \left[ \frac{(\hat{i} + \sqrt{11}\hat{j} - 2\hat{k}) \cdot (\hat{i} + \sqrt{11}\hat{j} - 10\hat{k})}{\sqrt{16}} \right] \frac{\hat{i} + \sqrt{11}\hat{j} - 2\hat{k}}{\sqrt{16}}$$

$$= \hat{i} + \sqrt{11}\hat{j} - 10\hat{k} - \frac{(1 + 11 + 20)}{4} \cdot \frac{(\hat{i} + \sqrt{11}\hat{j} - 2\hat{k})}{4}$$

$$= \hat{i} + \sqrt{11}\hat{j} + \sqrt{11}\hat{j} - 2\hat{k}$$

$$= -\hat{k} - 2(\hat{i} + \sqrt{11}\hat{j} - 2\hat{k})$$

$$= -(\hat{i} + \sqrt{11}\hat{j} - 6\hat{k} + 6\hat{k})$$

---

## Question33

Let  $\mathbf{a} = \hat{i} + 2\hat{j} + 2\hat{k}$  and  $\mathbf{b} = 2\hat{i} - \hat{j} + p\hat{k}$  be two vectors.

If  $(\mathbf{a}, \mathbf{b}) = 60^\circ$ , then  $p =$

**Options:**

A.

$$\frac{\sqrt{7}}{3\sqrt{2}}$$

B.

$$\frac{3\sqrt{5}}{\sqrt{7}}$$

C.

$$\frac{\sqrt{3}}{\sqrt{7}}$$

D.

$$\frac{\sqrt{5}}{\sqrt{7}}$$

**Answer: B**

**Solution:**

Given,  $\mathbf{a} = \hat{\mathbf{i}} + 2\hat{\mathbf{j}} + 2\hat{\mathbf{k}}$  and  $\mathbf{b} = 2\hat{\mathbf{i}} - \hat{\mathbf{j}} + p\hat{\mathbf{k}}$

$$\therefore \mathbf{a} \cdot \mathbf{b} = |\mathbf{a}||\mathbf{b}| \cos \theta$$

$$(2 - 2 + 2p) = \sqrt{9}\sqrt{5 + p^2} \cdot \cos 60^\circ$$

$$2p = 3\sqrt{5 + p^2} \frac{1}{2}$$

$$\Rightarrow 4p = 3\sqrt{5 + p^2}$$

$$\Rightarrow 16p^2 = 9(5 + p^2)$$

$$\Rightarrow 16p^2 = 45 + 9p^2$$

$$\Rightarrow 7p^2 = 45 \Rightarrow p^2 = \frac{45}{7}$$

$$\Rightarrow p = \frac{3\sqrt{5}}{\sqrt{7}}$$

---

## Question34

Let  $\pi_1$  be the plane determined by the vectors  $\hat{\mathbf{i}} + \hat{\mathbf{j}}$ ,  $\hat{\mathbf{i}} + \hat{\mathbf{k}}$  and  $\pi_2$  be the plane determined by the vectors  $\hat{\mathbf{j}} - \hat{\mathbf{k}}$ ,  $\hat{\mathbf{k}} - \hat{\mathbf{i}}$ . Let  $\mathbf{a}$  be a non-zero vector parallel to the line of intersection of the planes  $\pi_1$  and  $\pi_2$ . If  $\mathbf{b} = \hat{\mathbf{i}} + \hat{\mathbf{j}} - \hat{\mathbf{k}}$ , then the angle between the vectors  $\mathbf{a}$  and  $\mathbf{b}$  is

**Options:**

A.

$$\cos^{-1} \left( \sqrt{\frac{2}{3}} \right)$$

B.

$$\frac{\pi}{2}$$

C.

$$\cos^{-1}\left(\frac{1}{\sqrt{3}}\right)$$

D.

$$\cos^{-1}\left(\frac{\sqrt{2}}{3}\right)$$

**Answer: A**

**Solution:**

For  $\pi_1$ ,  $\mathbf{n}_1 = \mathbf{a} \times \mathbf{b}$

where,  $\mathbf{a} = \hat{\mathbf{i}} + \hat{\mathbf{j}}$

$$\mathbf{b} = \hat{\mathbf{i}} + \hat{\mathbf{k}}$$

$$\therefore \mathbf{n}_1 = \begin{vmatrix} \hat{\mathbf{i}} & \hat{\mathbf{j}} & \hat{\mathbf{k}} \\ 1 & 1 & 0 \\ 1 & 0 & 1 \end{vmatrix} = \hat{\mathbf{i}} - \hat{\mathbf{j}} - \hat{\mathbf{k}}$$

For  $\pi_2$ ,  $\mathbf{n}_2 = \mathbf{c} \times \mathbf{d}$  where  $\mathbf{c} = \hat{\mathbf{j}} - \hat{\mathbf{k}}$

$$\mathbf{d} = \hat{\mathbf{k}} - \hat{\mathbf{i}}$$

$$\mathbf{n}_2 = \begin{vmatrix} \hat{\mathbf{i}} & \hat{\mathbf{j}} & \hat{\mathbf{k}} \\ 0 & 1 & -1 \\ -1 & 0 & 1 \end{vmatrix} = \hat{\mathbf{i}} + \hat{\mathbf{j}} + \hat{\mathbf{k}}$$

Parallel vector line of intersection of  $\pi_1$  and  $\pi_2$

$$\mathbf{a} = \mathbf{n}_1 \times \mathbf{n}_2$$

$$\begin{aligned} \mathbf{n}_2 &= \begin{vmatrix} \hat{\mathbf{i}} & \hat{\mathbf{j}} & \hat{\mathbf{k}} \\ 1 & -1 & -1 \\ 1 & 1 & 1 \end{vmatrix} \\ &= \hat{\mathbf{i}}(-1 + 1) - \hat{\mathbf{j}}(1 + 1) + \hat{\mathbf{k}}(1 + 1) \\ &= -2\hat{\mathbf{j}} + 2\hat{\mathbf{k}} \end{aligned}$$

And  $\mathbf{b} = \hat{\mathbf{i}} + \hat{\mathbf{j}} - \hat{\mathbf{k}}$

$$\begin{aligned} \therefore \cos \theta &= \frac{\mathbf{a} \cdot \mathbf{b}}{|\mathbf{a}||\mathbf{b}|} \\ &= \left| \frac{-2 - 2}{\sqrt{4 + 4}\sqrt{3}} \right| = \left| \frac{4}{2\sqrt{2}\sqrt{3}} \right| \\ \theta &= \cos^{-1} \sqrt{\frac{2}{3}}. \end{aligned}$$

---

## Question35

The variance of the discrete data 3, 4, 5, 6, 7, 8, 10, 13 is

Options:

A.

7.5

B.

8

C.

9.5

D.

9

**Answer: C**

**Solution:**

Data  $x_i$  : 3, 4, 5, 6, 7, 8, 10, 13

$$\Sigma x_i = 3 + 4 + 5 + 6 + 7 + 8 + 10 + 13 = 56$$

$$\begin{aligned}\Sigma x_i^2 &= 9 + 16 + 25 + 36 + 49 + 64 + 100 + 169 \\ &= 468\end{aligned}$$

$$\begin{aligned}\text{Variance} &= \frac{\Sigma x_i^2}{n} - \left(\frac{\Sigma x_i}{n}\right)^2 \\ &= \frac{468}{8} - \left(\frac{56}{8}\right)^2 = 58.5 - 49 = 9.5\end{aligned}$$

---

## Question36

If a number  $x$  is drawn randomly from the set of numbers  $\{1, 2, 3, \dots, 50\}$ , then the probability that number  $x$  that is drawn satisfies the inequation  $x + \frac{10}{x} \leq 11$  is

Options:

A.

$$\frac{4}{5}$$

B.

$$\frac{9}{50}$$

C.

$$\frac{4}{25}$$

D.

$$\frac{1}{5}$$

**Answer: D**

**Solution:**

$$S = \{1, 2, \dots, 50\}$$

$$\because x + \frac{10}{x} \leq 11$$

$$x^2 - 11x + 10 \leq 0$$

$$(x - 10)(x - 1) \leq 0$$

$$x \in [1, 10]$$

$$\therefore \text{Required probability} = \frac{10}{50} = \frac{1}{5}$$

---

## Question37

**If a coin is tossed seven times, then the probability of getting exactly three heads such that number two heads occur consecutively is**

**Options:**

A.

$$\frac{5}{64}$$

B.

$$\frac{5}{32}$$

C.

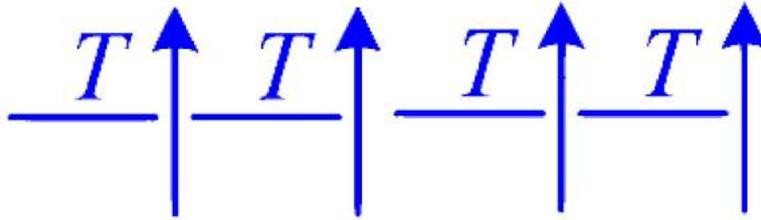

$$\frac{5}{128}$$

D.

**Answer: A**

**Solution:**

7 Toss - 3 Head 4 Tails

$$\begin{aligned}\therefore \text{Required probability} &= {}^5C_3 \left(\frac{1}{2}\right)^7 \\ &= 10 \times \frac{1}{128} = \frac{5}{64}\end{aligned}$$

---

## Question38

Two cards are drawn randomly from a pack of 52 playing cards one after the other with replacement. If  $A$  is the event of drawing a face card in first draw and  $B$  is the event of drawing a clubs card in second draw, then  $P\left(\frac{\bar{B}}{A}\right) =$

**Options:**

A.

$\frac{11}{12}$

B.

$\frac{12}{13}$

C.

$\frac{3}{4}$

D.

$\frac{1}{4}$

**Answer: C**

## Solution:

### Step 1: Find Probability of Drawing a Face Card First ( $P(A)$ )

There are 12 face cards in a deck of 52 cards. So,  $P(A) = \frac{12}{52} = \frac{3}{13}$ .

### Step 2: Find Probability of Drawing a Club Card Second ( $P(B)$ )

There are 13 clubs in the deck. So,  $P(B) = \frac{13}{52} = \frac{1}{4}$ .

### Step 3: Find $P\left(\frac{\bar{B}}{A}\right)$ (Probability of Not Drawing a Club in Second Draw Given First Card is Face Card)

We use the formula for conditional probability:  $P\left(\frac{\bar{B}}{A}\right) = \frac{P(\bar{B} \cap A)}{P(A)}$ .

The draws are independent, so  $P(\bar{B} \cap A) = P(\bar{B}) \cdot P(A)$ .

This means  $P\left(\frac{\bar{B}}{A}\right) = \frac{P(\bar{B}) \cdot P(A)}{P(A)} = P(\bar{B})$ .

We already have  $P(B)$ , so  $P(\bar{B}) = 1 - P(B) = 1 - \frac{1}{4} = \frac{3}{4}$ .

---

## Question39

If  $X$  is a random variable with probability distribution

$$P(X = k) = \frac{(2k+3)c}{3^k}, k = 0, 1, 2, \dots \text{ to } \infty, \text{ then } P(X = 3) =$$

Options:

A.

$$\frac{1}{24}$$

B.

$$\frac{1}{18}$$

C.

$$\frac{1}{6}$$

D.

$$\frac{1}{3}$$

**Answer: B**

**Solution:**

$$P(X = k) = \frac{2k + 3}{3^k} \cdot C$$

$$\Rightarrow \sum_{K=0}^{\infty} P(X = k) = 1$$

$$\Rightarrow \sum_{K=0}^{\infty} \frac{2k + 3}{3^k} \cdot c = 1$$

$$S = \sum_{K=0}^{\infty} \frac{2k + 3}{3^k}$$

$$\Rightarrow S = \frac{3}{3^0} + \frac{5}{3^1} + \frac{7}{3^2} + \frac{9}{3^3} + \dots$$

$$\Rightarrow \frac{1}{3}S = \frac{3}{3^1} + \frac{5}{3^2} + \frac{7}{3^3} + \dots$$

$$\Rightarrow \frac{2S}{3} = 3 + 2 \left( \frac{1}{3} + \frac{1}{3^2} + \frac{1}{3^3} + \dots \right)$$

$$= 3 + 2 \left( \frac{\frac{1}{3}}{1 - \frac{1}{3}} \right) = 3 + 1$$

$$\Rightarrow \frac{2S}{3} = 4 \Rightarrow S = 6$$

$$\therefore 6c = 1 \Rightarrow c = \frac{1}{6}$$

$$\text{Now, } P(X = 3) = \frac{6 + 3}{3^3} \times \frac{1}{6} = \frac{1}{18}.$$

---

## Question40

If a poisson variate  $X$  satisfies the relation  $P(X = 3) = P(X = 5)$ , then  $P(X = 4) =$

**Options:**

A.

$$\frac{50}{3e^{\sqrt{20}}}$$

B.

$$\frac{20000}{3e^{20}}$$

C.

$$\frac{125}{3e^{10}}$$

D.

$$\frac{25}{3e^{\sqrt{20}}}$$

**Answer: A**

**Solution:**

$$\therefore P(X = K) = \frac{e^{-\lambda} \lambda^K}{K!}$$

$$\therefore P(X = 3) = P(X = 5)$$

$$\Rightarrow \frac{e^{-\lambda} \lambda^3}{3!} = \frac{e^{-\lambda} \lambda^5}{5!}$$

$$\Rightarrow \lambda^2 = \frac{120}{6} = 20$$

$$\Rightarrow \lambda = \sqrt{20} = 2\sqrt{5}$$

$$\begin{aligned} \therefore P(X = 4) &= \frac{e^{-\lambda} \lambda^4}{4!} = \frac{e^{-2\sqrt{5}} (\sqrt{20})^4}{24} \\ &= \frac{400}{24e^{2\sqrt{5}}} = \frac{50}{3e^{2\sqrt{5}}} \end{aligned}$$

---

## Question41

The equation of the locus of a point, which is at a distance of 5 units from a fixed point  $(1, 4)$  and also from a fixed line  $2x + 3y - 1 = 0$  is

**Options:**

A.

$$9x^2 + 12xy + 4y^2 - 30x - 108y + 222 = 0$$

B.

$$9x^2 - 12xy + 4y^2 - 30x - 98y + 220 = 0$$

C.

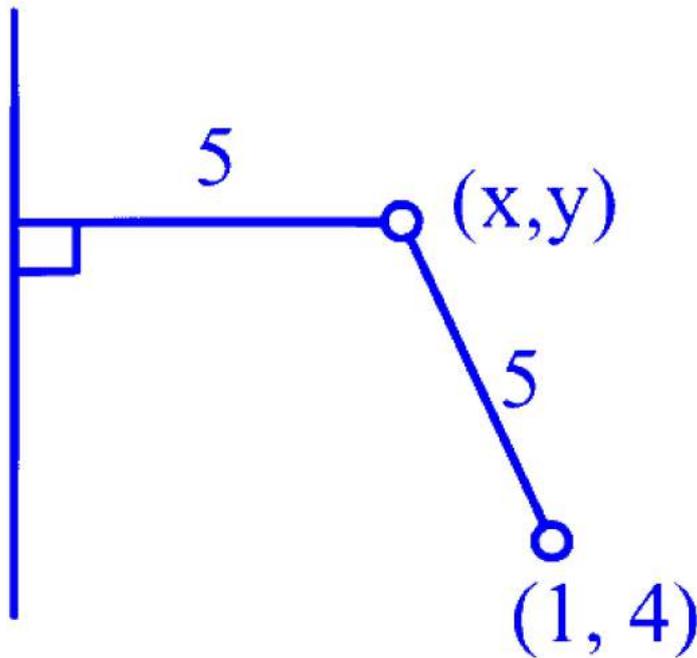

$$9x^2 + 12xy + 4y^2 - 22x - 108y + 222 = 0$$

D.

$$9x^2 - 12xy + 4y^2 - 22x - 98y + 220 = 0$$

**Answer: D**

**Solution:**

$$\Rightarrow (x - 1)^2 + (y - 4)^2 = \frac{(2x + 3y - 1)^2}{(4 + 9)}$$

$$\Rightarrow (x^2 + y^2 - 2x - 8y + 1 + 16)(13) = 4x^2 + 9y^2 + 1 + 12xy - 6y - 4x$$

$$\Rightarrow 9x^2 + 4y^2 - 12xy - 22x - 98y + 220 = 0$$

## Question42

If  $2x^2 + xy - 6y^2 + k = 0$  is the transformed equation of  $2x^2 + xy - 6y^2 - 13x + 9y + 15 = 0$  when the origin is shifted to the point  $(a, b)$  by translation of axes, then  $k =$

Options:

A.

1

B.

0

C.

21

D.

15

**Answer: B**

## **Solution:**

Now, equation

$$2x^2 + xy - 6y^2 + k = 0$$

Old equation

$$2x^2 + xy - 6y^2 - 13x + 9y + 15 = 0$$

Origin is shifted to  $(a, b)$

$$2(x - a)^2 + (x - a)(y - b) - 6(y - b)^2 - 13(x - a) + 9(y - b) + 15 = 0$$

$\therefore$  Coefficient of  $x = 0$

$$4a + b - 13 = 0 \quad \dots (i)$$

Coefficient of  $y = 0$

$$a - 12b + 9 = 0 \quad \dots (ii)$$

Solving Eqs. (i) and (ii) we get

$$a = 3 \text{ and } b = 1$$

$\therefore$  Constant

$$\Rightarrow k = 2a^2 + ab - 6b^2 - 13a + 9b + 15$$

Put  $a = 3$  and  $b = 1$

$$k = 0$$

---

## **Question43**

**The line  $L \equiv 6x + 3y + k = 0$  divides the line segment joining the points  $(3, 5)$  and  $(4, 6)$  in the ratio  $-5 : 4$ . If the point of intersection of the lines  $L = 0$  and  $x - y + 1 = 0$  is  $P(g, h)$ , then  $h =$**

**Options:**

A.

$$2g$$

B.

$$2g - 1$$

C.

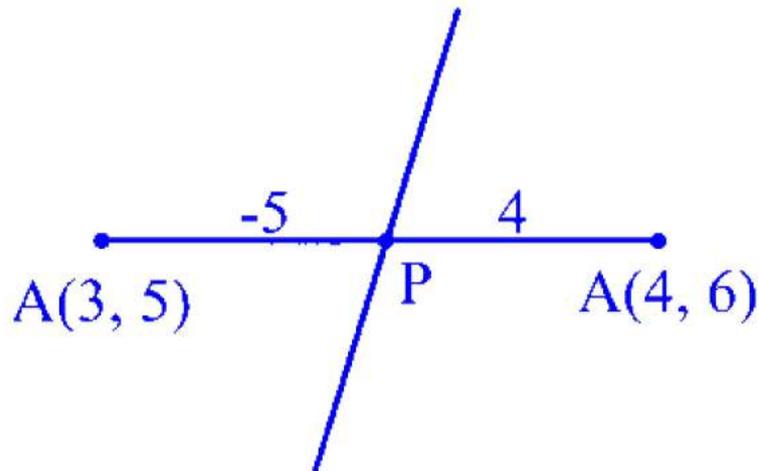

$3g$

D.

$g + 1$

**Answer: D**

**Solution:**

$$\begin{aligned} \text{Point } P &= \left( \frac{-20 + 12}{-5 + 4}, \frac{-30 + 20}{-5 + 4} \right) \\ &= \left( \frac{-8}{-1}, \frac{-10}{-1} \right) = (8, 10) \end{aligned}$$

$\therefore P$  lies on line  $6x + 3y + k = 0$

$$\begin{aligned} \therefore 6(8) + 3(10) + k &= 0 \\ k &= -78 \end{aligned}$$

$\therefore$  Equation of line  $6x + 3y - 78 = 0$

$$\Rightarrow 2x + y - 26 = 0$$

$\therefore$  Point of intersection of  $2x + y - 26 = 0$  and  $x - y + 1 = 0$  is  $(g, h) = (8, 9)$

$$\begin{aligned} \therefore g - h + 1 &= 0 \\ h &= g + 1 \end{aligned}$$

---

## Question44

A straight line through the point  $P(1, 2)$  makes an angle  $\theta$  with positive X-axis in anticlockwise direction and meets the line  $x + \sqrt{3}y - 2\sqrt{3} = 0$  at  $Q$ . If  $PQ = \frac{1}{2}$ , then  $\theta =$

**Options:**

A.

$$\frac{\pi}{6}$$

B.

$$\frac{5\pi}{6}$$

C.

$$\frac{2\pi}{3}$$

D.

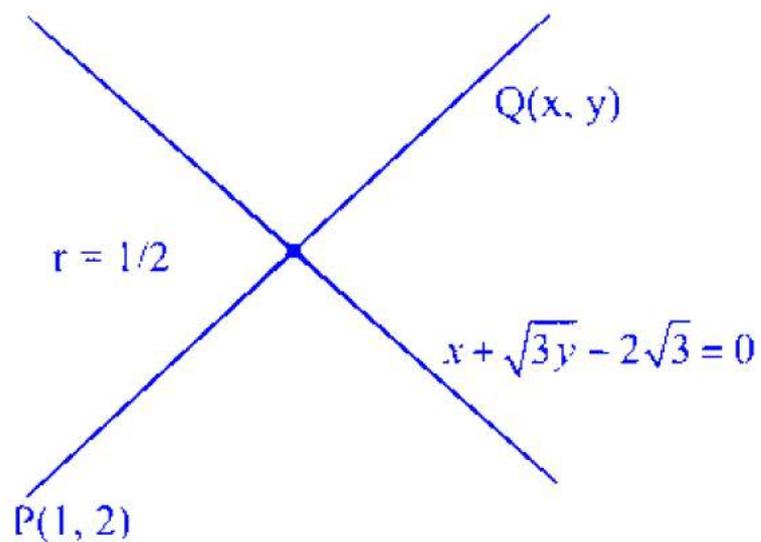

$$\frac{\pi}{3}$$

**Answer: D**

**Solution:**

$$x - 1 = \pm \frac{1}{2} \cos \theta$$

$$y - 2 = \pm \frac{1}{2} \sin \theta$$

$$x = \pm \frac{\cos \theta}{2} + 1$$

$$y = \pm \frac{\sin \theta}{2} + 2$$

$$\therefore \theta \text{ lies on line } x + \sqrt{3}y - 2\sqrt{3} = 0$$

$$\pm \frac{\cos \theta}{2} + 1 \pm \frac{\sqrt{3}}{2} \sin \theta + 2\sqrt{3} - 2\sqrt{3} = 0$$

$$\Rightarrow \pm \left( \frac{\sqrt{3}}{2} \sin \theta + \frac{1}{2} \cos \theta \right) = -1$$

$$\Rightarrow \sin \left( \theta + \frac{\pi}{6} \right) = \pm 1$$

$$\Rightarrow \theta + \frac{\pi}{6} = \frac{\pi}{2} \text{ or } -\frac{\pi}{2}$$

$$\Rightarrow \theta = \frac{\pi}{3} \text{ or } \frac{-2\pi}{3}$$

---

## Question45

The lines  $x - 2y + 1 = 0$ ,  $2x - 3y - 1 = 0$  and  $3x - y + k = 0$  are concurrent. The angle between the lines  $3x - y + k = 0$  and  $mx - 3y + 6 = 0$  is  $45^\circ$ . If  $m$  is an integer, then  $m - k =$

Options:

A.

-6

B.

18

C.

6

D.

-18

**Answer: C**

**Solution:**

$$\begin{array}{l}
 L_1 \quad x - 2y + 1 = 0 \\
 L_2 \quad 2x - 3y - 1 = 0 \\
 L_3 \quad 3x - y + k = 0
 \end{array}
 \begin{array}{l}
 \diagdown \\
 \diagup
 \end{array}
 \text{Concurrent}$$

$$\begin{vmatrix}
 1 & -2 & 1 \\
 2 & -3 & -1 \\
 3 & -1 & k
 \end{vmatrix} = 0$$

$$\Rightarrow 1(-3k - 1) + 2(2k + 3) + 1(-2 + 9) = 0$$

$$\Rightarrow -3k - 1 + 4k + 6 + 7 = 0$$

$$\Rightarrow k = -12$$

$$L_1 : 3x - y + k = 0$$

$$\Rightarrow 3x - y - 12 = 0 \Rightarrow m_1 = 3$$

$$L_2 : mx - 3y + 6 = 0$$

$$\Rightarrow m_2 = \frac{m}{3}$$

$$\tan \theta = \left| \frac{m_1 - m_2}{1 + m_1 m_2} \right|$$

$$\tan 45^\circ = \left| \frac{3 - \frac{m}{3}}{1 + m} \right|$$

## Question46

If  $\tan^{-1}(2\sqrt{10})$  is the angle between the lines  $ax^2 + 4xy - 2y^2 = 0$  and  $a \in \mathbb{Z}$ , then the product of the slopes of given lines is

Options:

A.

$$\frac{3}{2}$$

B.

$$\frac{2}{3}$$

C.

$$-\frac{2}{3}$$

D.

$$-\frac{3}{2}$$

**Answer: D**

## Solution:

$$\begin{aligned}ax^2 + 4xy - 2y^2 = 0, h = 2a \\ \tan \theta = \left| \frac{2\sqrt{h^2 - ab}}{a + b} \right| \\ \Rightarrow 2\sqrt{10} = \left| \frac{2\sqrt{4 + 2a}}{a - 2} \right| \\ \Rightarrow 10 = \frac{4 + 2a}{(a - 2)^2} \\ \Rightarrow 5(a^2 - 4a + 4) = a + 2 \\ \Rightarrow 5a^2 - 21a + 18 = 0 \\ \Rightarrow 5a^2 - 15a - 6a + 18 = 0 \\ \Rightarrow 5a(a - 3) - 6(a - 3) = 0 \\ a = 3, a = \frac{6}{5} \\ \because a \in Z \\ \therefore a = 3 \\ \therefore m_1 m_2 = \frac{a}{b} = \frac{3}{-2} = \frac{-3}{2}.\end{aligned}$$

---

## Question47

If the equation of the circumcircle of the triangle formed by the lines

$$L_1 \equiv x + y = 0,$$

$$L_2 \equiv 2x + y - 1 = 0, L_3 \equiv x - 3y + 2 = 0 \text{ is}$$

$$\lambda_1 L_1 L_2 + \lambda_2 L_2 L_3 + \lambda_3 L_3 L_1 = 0, \text{ then } \frac{7\lambda_1}{\lambda_2} + \frac{\lambda_3}{\lambda_1} =$$

Options:

A.

1

B.

2

C.

3

D.

**Answer: C**

**Solution:**

$$L_1 : x + y = 0$$

$$L_2 : 2x + y - 1 = 0$$

$$L_3 : x - 3y + 2 = 0$$

Now, equation of circumcircle

$$\lambda_1 L_1 L_2 + \lambda_2 L_2 L_3 + \lambda_3 L_3 L_1 = 0$$

$$\lambda_1(x + y)(2x + y - 1) + \lambda_2(2x + y - 1)(x - 3y + 2) + \lambda_3(x - 3y + 2)(x + y) = 0$$

Coefficient of  $x^2 =$  Coefficient of  $y^2$

$$2\lambda_1 + 2\lambda_2 + \lambda_3 = \lambda_1 - 3\lambda_2 - 3\lambda_3$$

$$\lambda_1 + 5\lambda_2 + 4\lambda_3 = 0$$

$$5\lambda_2 = -\lambda_1 - 4\lambda_3 \quad \dots (i)$$

Coefficient of  $xy = 0$

$$3\lambda_1 - 5\lambda_2 - 2\lambda_3 = 0$$

$$5\lambda_2 = 3\lambda_1 - 2\lambda_3 \quad \dots (ii)$$

From Eqs. (i) and (ii),

$$\begin{aligned} \therefore -\lambda_1 - 4\lambda_3 &= 3\lambda_1 - 2\lambda_3 \\ 4\lambda_1 &= -2\lambda_3 \Rightarrow \lambda_3 = -2\lambda_1 \\ \frac{\lambda_1}{\lambda_3} &= \frac{-1}{2} \end{aligned}$$

$$\text{And } 5\lambda_2 = -\lambda_1 + 8\lambda_1 = 7\lambda_1$$

$$\lambda_2 = \frac{7\lambda_1}{5} \Rightarrow \frac{\lambda_1}{\lambda_2} = \frac{5}{7}$$

$$\therefore \frac{7\lambda_1}{\lambda_2} + \frac{\lambda_3}{\lambda_1} = 7 \times \frac{5}{7} - 2 = 5 - 2 = 3$$

## Question 48

**A circle  $C$  touches  $X$ -axis and makes an intercept of length 2 units on  $Y$ -axis. If the centre of this circle lies on the line  $y = x + 1$ , then a circle passing through the centre of the circle  $C$  is**

**Options:**

A.

$$x^2 + y^2 - 2x - 4y + 1 = 0$$

B.

$$x^2 + y^2 - 26x - 20y + 19 = 0$$

C.

$$x^2 + y^2 - 20x - 26y + 19 = 0$$

D.

$$x^2 + y^2 + 2x - 4y + 1 = 0$$

**Answer: B**

**Solution:**

$$x_{\text{intercept}} = 0$$

$$y_{\text{intercept}} = 2$$

Centre lies on  $y = x + 1$

Let equation of circle

$$x^2 + y^2 + 2gx + 2fy + c = 0$$

$$\text{Centre } (-g, -f) \Rightarrow -f = -g + 1$$

$$f = g - 1 \quad \dots (i)$$

$$x_{\text{intercept}} = 2\sqrt{g^2 - c} = 0$$

$$\Rightarrow g^2 = c$$

$$y_{\text{intercept}} = 2\sqrt{f^2 - c} = 2$$

$$\Rightarrow f^2 - c = 1$$

$$f^2 - g^2 = 1$$

$$(f - g)(f + g) = 1$$

$$f + g = -1 \quad [ \because f - g = -1 ]$$

$$\therefore f = -1, \quad g = 0$$

$\therefore$  Centre is  $(0, 1)$ .

Which satisfies

$$x^2 + y^2 - 26x - 20y + 19 = 0$$

---

**Question49**

If  $m_1, m_2$  are the slopes of the tangents drawn through the point  $(-1, -2)$  to the circle  $(x - 3)^2 + (y - 4)^2 = 4$ , then  $\sqrt{3} |m_1 - m_2| =$

Options:

A.

1

B.

2

C.

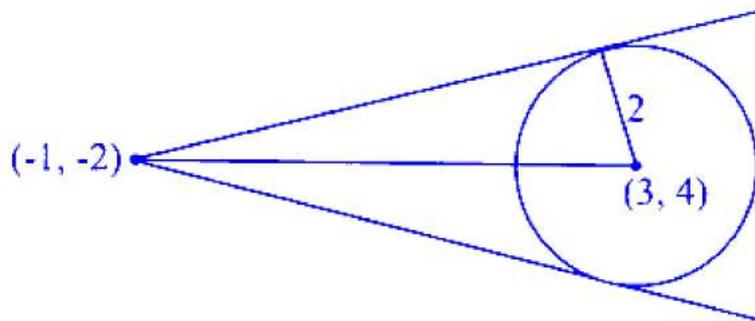

3

D.

4

**Answer: D**

**Solution:**

Let equation of tangent be

$$y + 2 = m(x + 1) \Rightarrow mx - y + m - 2 = 0$$

$\therefore$  1 st distance from centre = radius

$$\left| \frac{3m - 4 + m - 2}{\sqrt{1 + m^2}} \right| = 2$$

$$\Rightarrow (4m - 6)^2 = 4(1 + m^2)$$

$$\Rightarrow 3m^2 - 12m + 8 = 0$$

$$\therefore \sqrt{3} |m_1 - m_2| = \sqrt{3} \frac{\sqrt{D}}{a}$$

$$= \sqrt{3} \frac{\sqrt{144 - 4 \times 8 \times 3}}{3}$$

$$= \frac{4}{\sqrt{3}} \times \sqrt{3} = 4$$

## Question50

A line meets the circle  $x^2 + y^2 - 4x - 4y - 8 = 0$  in two points  $A$  and  $B$ . If  $P(2, -2)$  is a point on the circle such that  $PA = PB = 2$ , then the equation of the line  $AB$  is

Options:

A.

$$2x + 3y = 0$$

B.

$$3x + 2y = 0$$

C.

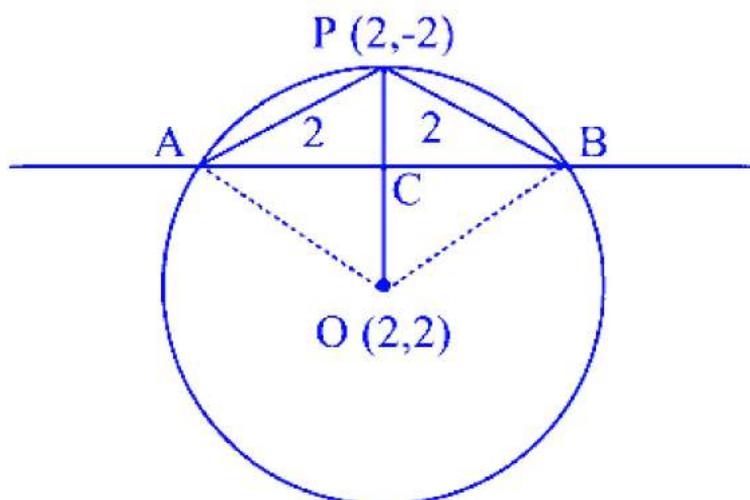

$$2x + 3 = 0$$

D.

$$2y + 3 = 0$$

**Answer: D**

**Solution:**

$$\because PA = PB$$

$$\therefore \triangle OAP \cong \triangle OPB.$$

(  $O$  is centre of circle

$$x^2 + y^2 - 4x - 4y - 8 = 0$$

$$r = \sqrt{4 + 4 + 8} = 4$$

∴ Equation of circle at  $P$  and radius 4 is

$$(x - 2)^2 + (y + 2)^2 = 2^2$$

∴  $AB$  is common chord

∴ Equation is  $S_1 - S_2 = 0$

$$(x^2 + y^2 - 4x - 4y - 8)$$

$$- (x^2 + y^2 - 4x + 4y + 4 + 4 - 4) = 0$$

$$\Rightarrow -8y - 8 - 4 = 0$$

$$\Rightarrow 8y + 12 = 0$$

$$2y + 3 = 0$$

---

## Question51

If the centre  $(\alpha, \beta)$  of a circle cutting the circles  $x^2 + y^2 - 2y - 3 = 0$  and  $x^2 + y^2 + 4x + 3 = 0$  orthogonally lies on the line  $2x - 3y + 4 = 0$ , then  $2\alpha + \beta =$

Options:

A.

3

B.

-3

C.

0

D.

1

**Answer: B**

**Solution:**

∴ If two circles cut orthogonally.

$$\Rightarrow 2g_1g_2 + 2f_1f_2 = c_1c_2$$

$$S_1 : x^2 + y^2 - 2y - 3 = 0$$

$$S_2 : x^2 + y^2 + 4x + 3 = 0$$

$$S_3 : x^2 + y^2 - 2\alpha x - 2\beta y + c = 0 \rightarrow \text{centre}$$

$(\alpha, \beta)$

$$\therefore 2(-\alpha)(0) + 2(-\beta)(-1) = c - 3$$

$$2\beta = c - 3 \quad \dots (i)$$

$$\text{And } 2(-\alpha)(2) + 2\beta(0) = c + 3$$

$$-4\alpha = c + 3 \Rightarrow 4\alpha = -c - 3 \quad \dots (ii)$$

On adding Eqs. (i) and (ii), we get

$$4\alpha + 2\beta = -6$$

$$\Rightarrow 2\alpha + \beta = -3$$

---

## Question52

The radius of a circle  $C_1$  is thrice the radius of another circle  $C_2$  and the centres of  $C_1$  and  $C_2$  are  $(1, 2)$  and  $(3, -2)$  respectively. If they cut each other orthogonally and the radius of the circle  $C_1$  is  $3r$ , then the equation of the circle with  $r$  as radius and  $(1, -2)$  as centre is

Options:

A.

$$x^2 + y^2 - 2x + 4y - 3 = 0$$

B.

$$x^2 + y^2 - 2x + 4y + 7 = 0$$

C.

$$x^2 + y^2 - 2x + 4y - 7 = 0$$

D.

$$x^2 + y^2 - 2x + 4y + 3 = 0$$

**Answer: D**

**Solution:**

Circle  $C_1 \rightarrow$  radius  $r_1, O_1(1, 2), r_1 = 3r'$

Circle  $C_2 \rightarrow$  radius  $r_2$ ,  $O_2(3, -2)$ ,  $r_2 = r'$

$\therefore C_1$  and  $C_2$  cuts orthogonally

$$r_1^2 + r_2^2 = O_1O_2^2$$

$$\Rightarrow (3r')^2 + r'^2 = 2^2 + 4^2$$

$$\Rightarrow 10r'^2 = 20 \Rightarrow r' = 2$$

$\therefore$  Equation of required circle

$$\Rightarrow (x - 1)^2 + (y + 2)^2 = 2$$

$$\Rightarrow x^2 + y^2 - 2x + 4y + 3 = 0$$

---

## Question 53

If the normals drawn at the points  $P\left(\frac{3}{4}, \frac{3}{2}\right)$  and  $Q(3, 3)$  on the parabola  $y^2 = 3x$  intersect again on  $y^2 = 3x$  at  $R$ , then  $R =$

Options:

A.

$(12, 6)$

B.

$\left(\frac{27}{4}, -\frac{9}{2}\right)$

C.

$\left(\frac{3}{16}, \frac{3}{4}\right)$

D.

$\left(\frac{1}{12}, -\frac{1}{2}\right)$

**Answer: B**

**Solution:**

Given,  $y^2 = 3x$

Differential w.r.t.  $x$ , we get

$$2y \frac{dy}{dx} = 3 \Rightarrow \frac{dy}{dx} = \frac{3}{2y}$$

Slope of tangent at  $(x_1, y_1) = m_t = \frac{3}{2y_1}$

$$\text{Slope of normal} = m_n = \frac{-2y_1}{3}$$

∴ Equation of normal

$$y - y_1 = \frac{-2y_1}{3}(x - x_1)$$

$$\text{Put } (x_1, y_1) = \left(\frac{3}{4}, \frac{3}{2}\right)$$

$$\Rightarrow y - \frac{3}{2} = -\frac{2\left(\frac{3}{2}\right)}{3} \cdot \left(x - \frac{3}{4}\right)$$

$$\Rightarrow y + x = \frac{3}{4} + \frac{3}{2} = \frac{9}{4}$$

$$\Rightarrow 4x + 4y = 9 \quad \dots (i)$$

From  $Q(3, 3)$

$$y - 3 = \frac{-2 \times 3}{3}(x - 3)$$

$$\Rightarrow y + 2x = 9 \quad \dots (ii)$$

From Eqs. (i) and (ii), we get

$$x = \frac{27}{4}, y = \frac{-9}{2}$$

$$\therefore R \equiv \left(\frac{27}{4}, \frac{-9}{2}\right)$$

---

## Question54

If  $\theta$  is the acute angle between the tangents drawn from the point  $(1, 5)$  to the parabola  $y^2 = 9x$ , then

Options:

A.

$$\frac{\pi}{6} < \theta < \frac{\pi}{4}$$

B.

$$\frac{\pi}{3} < \theta < \frac{\pi}{2}$$

C.

$$0 < \theta < \frac{\pi}{6}$$

D.

$$\frac{\pi}{4} < \theta < \frac{\pi}{3}$$

**Answer: D**

## Solution:

$$y^2 = 9x$$

$$\Rightarrow a = \frac{9}{4}$$

Equation of tangent to parabola

$$y = mx + \frac{a}{m}$$

$$\Rightarrow y = mx + \frac{9}{4m}$$

Since, tangents are drawn from point (1, 5)

$$\Rightarrow 5 = m + \frac{9}{4m}$$

$$\Rightarrow 4m^2 - 20m + 9 = 0$$

$$\Rightarrow m = \frac{20 \pm \sqrt{400 - 144}}{8} = \frac{20 \pm 16}{2}$$

$$\Rightarrow m = \frac{9}{2}, \frac{1}{2}$$

$$\therefore \tan \theta = \left| \frac{m_1 - m_2}{1 + m_1 m_2} \right| = \left| \frac{\frac{9}{2} - \frac{1}{2}}{1 + \frac{9}{4}} \right|$$

$$= \frac{16}{13} \approx 1.23$$

$$\Rightarrow 1 < \frac{16}{13} < \sqrt{3}$$

$$\Rightarrow \tan \frac{\pi}{4} < \tan \theta < \tan \frac{\pi}{3}$$

$$\therefore \frac{\pi}{4} < \theta < \frac{\pi}{3}.$$

---

## Question55

Let  $P$  be a point on the ellipse  $\frac{x^2}{9} + \frac{y^2}{4} = 1$  and let the perpendicular drawn through  $P$  to the major axis meet its auxiliary circle at  $Q$ . If the normals drawn at  $P$  and  $Q$  to the ellipse and the auxiliary circle respectively meet in  $R$ , then the equation of the locus of  $R$  is

Options:

A.

$$x^2 + y^2 = 5$$

B.

$$x^2 + y^2 = 13$$

C.

$$x^2 + y^2 = 25$$

D.

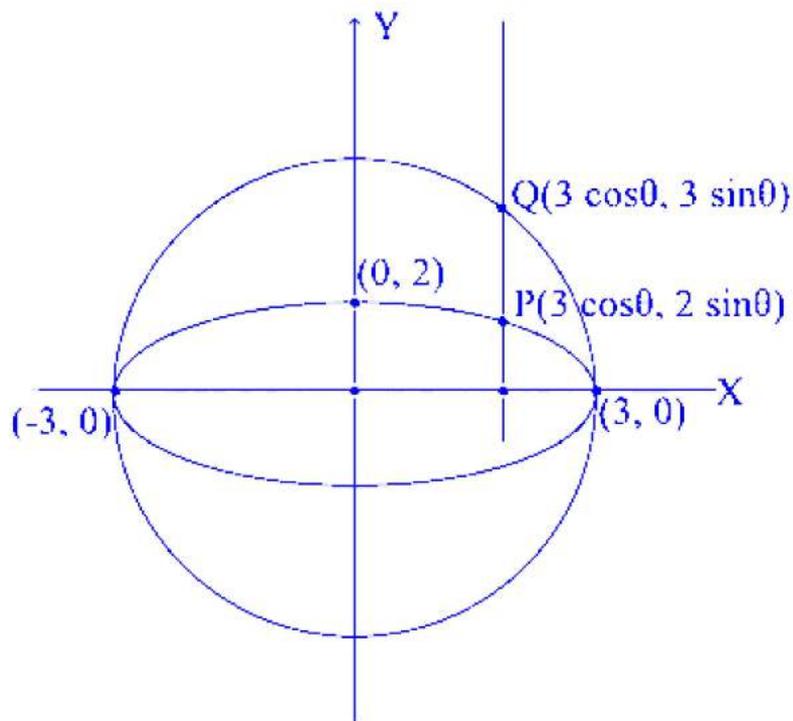

$$x^2 + y^2 = 1$$

**Answer: C**

**Solution:**

We have,  $a = 3, b = 2$

$$P(3 \cos \theta, 2 \sin \theta)$$

Equation of normal at  $P$ .

$$\frac{3x}{\cos \theta} - \frac{2y}{\sin \theta} = 5 \quad \dots (i)$$

Equation of auxiliary circle  $x^2 + y^2 = 13$

$\therefore$  Normal of circle passes through centre

$$\therefore Q = (3 \cos \theta, 3 \sin \theta)$$

Normal at  $Q$  to circle

$$y = x \tan \theta$$
$$\Rightarrow x = y \cot \theta \quad \dots (ii)$$

Solving Eqs. (i) and (ii), we get

$$y = 5 \sin \theta$$
$$x = 5 \cos \theta$$

∴ Locus of  $R$  is  $x^2 + y^2 = 25$

---

## Question 56

The mid-point of the chord of the ellipse  $x^2 + \frac{y^2}{4} = 1$  formed on the line  $y = x + 1$  is

Options:

A.

$$\left(\frac{4}{5}, \frac{9}{5}\right)$$

B.

$$\left(-\frac{1}{5}, \frac{4}{5}\right)$$

C.

$$\left(\frac{1}{5}, \frac{6}{5}\right)$$

D.

$$\left(-\frac{6}{5}, -\frac{1}{5}\right)$$

**Answer: B**

**Solution:**

Let mid-point of chord be  $P(x_1, y_1)$

∴ Equation of chord to ellipse  $x^2 + \frac{y^2}{4} = 1$  is  $T = S_1$

$$xx_1 + \frac{yy_1}{4} - 1 = x_1^2 + \frac{y_1^2}{4} - 1$$

$$xx_1 + \frac{yy_1}{4} = x_1^2 + \frac{y_1^2}{4}$$

Given,  $x - y = -1$

$$\frac{x_1}{1} = \frac{\frac{y_1}{4}}{-1} = \frac{x_1^2 + \frac{y_1^2}{4}}{-1}$$

$$y_1 = -4x_1 \quad \dots (i)$$

$$\text{And } -x_1 = x_1^2 + \frac{y_1^2}{4}$$

By Eq. (i)

$$-x_1 = x_1^2 + 4x_1^2 \Rightarrow 5x_1^2 = -x_1$$

$$\therefore x_1 = \frac{-1}{5} \text{ and } y_1 = \frac{4}{5}$$

---

## Question 57

If the tangent drawn at the point  $P(3\sqrt{2}, 4)$  on the hyperbola  $\frac{x^2}{9} - \frac{y^2}{16} = 1$  meets its directrix at  $Q(\alpha, \beta)$  in fourth quadrant, then  $\beta =$

Options:

A.

$$\frac{5\sqrt{2}-9}{4}$$

B.

$$-\frac{9}{5}$$

C.

$$\frac{12\sqrt{2}-20}{5}$$

D.

$$-\frac{5}{4}$$

**Answer: C**

**Solution:**

Tangent at  $P(3\sqrt{2}, 4)$  on hyperbola

$$\frac{x^2}{9} - \frac{y^2}{16} = 1 \text{ is } T = 0$$

$$\frac{x(3\sqrt{2})}{9} - \frac{y(4)}{16} = 1$$

$$\Rightarrow \frac{\sqrt{2}x}{3} - \frac{y}{4} = 1$$

$$\Rightarrow 4\sqrt{2}x - 3y - 12 = 0 \quad \dots (i)$$

$$\therefore a = 3, b = 4$$

$$\Rightarrow e = \sqrt{1 + \frac{16}{9}} = \frac{5}{3}$$

$$\text{Equation of directrix } \Rightarrow x = \pm \frac{a}{e}.$$

$$x = \pm \frac{9}{5} \Rightarrow y = \frac{4\sqrt{2}x - 12}{3}$$

at  $x = \frac{9}{5}$

$$\therefore y = \frac{12\sqrt{2} - 20}{5} = \beta$$

## Question 58

If  $m : n$  is the ratio in which the point  $(\frac{8}{5}, -\frac{1}{5}, \frac{8}{5})$  divides the segment joining the points  $(2, p, 2)$  and  $(p, -2, p)$ , where  $p$  is an integer then  $\frac{3m+n}{3n} =$

Options:

A.

$p$

B.

$2p$

C.

$3p$

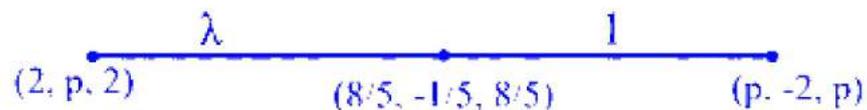

D.

$4p$

**Answer: A**

**Solution:**

$$\text{Let } \frac{m}{n} = \frac{\lambda}{1}$$

$$\frac{p\lambda + 2}{\lambda + 1} = \frac{8}{5}$$

$$5p\lambda + 10 = 8\lambda + 8$$

$$5p\lambda - 8\lambda = -2$$

$$\lambda(8 - 5p) = 2 \quad \dots (i)$$

$$\frac{-2\lambda + p}{\lambda + 1} = \frac{-1}{5}$$

$$-10\lambda + 5p = -\lambda - 1 \Rightarrow 5p + 1 = 9\lambda$$

$$\lambda = \frac{5p + 1}{9} \quad \dots (ii)$$

$$\frac{\lambda p + 2}{\lambda + 1} = \frac{8}{5} \quad \dots (iii)$$

Solving Eqs. (i) and (ii), we get

$$\left(\frac{5p+1}{9}\right)(8 - 5p) = 2$$

$$\Rightarrow (5p + 1)(8 - 5p) = 18$$

$$\Rightarrow 40p - 25p^2 + 8 - 5p - 18 = 0$$

$$\Rightarrow -25p^2 + 35p - 10 = 0$$

$$\Rightarrow 5p^2 - 7p + 2 = 0$$

$$\therefore p = 1 \quad (\because p \in \mathbb{Z})$$

$$\lambda = \frac{5+1}{9} = \frac{6}{9} = \frac{2}{3}.$$

$$\begin{aligned} \because \frac{m}{n} = \lambda \therefore \frac{3m+n}{3n} &= \frac{m}{n} + \frac{1}{3} \\ &= \frac{2}{3} + \frac{1}{3} = 1 = p \end{aligned}$$

---

## Question59

If  $(\alpha, \beta\gamma)$  is the foot of the perpendicular drawn from a point  $(-1, 2, -1)$  to the line joining the points  $(2, -1, 1)$  and  $(1, 1 - 2)$ , then  $\alpha + \beta + \gamma =$

**Options:**

A.

2

B.

$-\frac{1}{7}$

C.

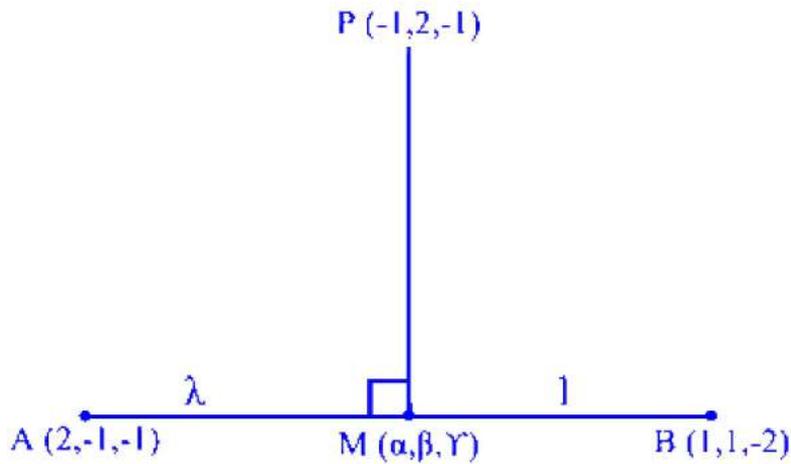

0

D.

$\frac{3}{14}$

**Answer: B**

## Solution:

Let  $M$  be the foot of perpendicular

$$M = \left( \frac{\lambda+2}{\lambda+1}, \frac{\lambda-1}{\lambda+1}, \frac{-2\lambda+1}{\lambda+1} \right)$$

$$\because \mathbf{PM} \cdot \mathbf{AB} = 0$$

$$\left( \frac{\lambda+2}{\lambda+1} + 1 \right)(1) + \left( \frac{\lambda-1}{\lambda+1} - 2 \right)(-2) + \left( \frac{-2\lambda+1}{\lambda+1} + 1 \right)3 = 0$$

$$\therefore 2\lambda + 3 - 2(-\lambda - 3) + 3(-\lambda + 2) = 0$$

$$\Rightarrow 2\lambda + 3 + 2\lambda + 6 - 3\lambda + 6 = 0 \Rightarrow \lambda = -15$$

$$\therefore \alpha + \beta + \gamma = \frac{\lambda+2 + \lambda-1 - 2\lambda+1}{\lambda+1}$$

$$= \frac{2}{\lambda+1} = \frac{2}{-15+1} = \frac{-1}{7}$$

---

## Question60

If  $A(2, 1, -1)$ ,  $B(6, -3, 2)$ ,  $C(-3, 12, 4)$  are the vertices of a  $\triangle ABC$  and the equation of the plane containing the  $\triangle ABC$  is

$$53x + by + cz + d = 0, \text{ then } \frac{d}{b+c} =$$

Options:

A.

-5

B.

1

C.

4

D.

-15

**Answer: D**

**Solution:**

Equation of plane containing  $A(2, 1, -1), B(6, -3, 2)C(-3, 12, 4)$  is

$$\begin{vmatrix} x-2 & y-1 & z+1 \\ 4 & -4 & 3 \\ 9 & -15 & -2 \end{vmatrix} = 0$$

$$\Rightarrow (x-2)(8+45) - (y-1)(-8-27) + (z+1)(-60+36) = 0$$

$$\Rightarrow 53x - 106 + 35y - 35 - 24z - 24 = 0$$

$$\Rightarrow 53x + 35y - 24z - 165 = 0$$

$$\therefore \frac{d}{b+c} = \frac{-165}{35-24} = \frac{-165}{11} = -15$$

---

## Question61

If  $\{x\} = x - [x]$ , where  $[x]$  is the greatest integer  $\leq x$  and

$$\lim_{x \rightarrow 0^-} \frac{\cos^{-1}(1-\{x\}^2) \sin^{-1}(1-\{x\})}{\{x\} - \{x\}^4} = \theta, \text{ then } \tan \theta$$

**Options:**

A.

$$\frac{1}{\sqrt{3}}$$

B.

1

C.

$$\sqrt{3}$$

D.

$\infty$

**Answer: A**

**Solution:**

$$\lim_{x \rightarrow 0^-} \frac{\cos^{-1}(1 - \{x\}^2) \sin^{-1}(1 - \{x\})}{\{x\}(1 - \{x\}^3)}$$

If  $x \rightarrow 0^-$ ,  $\{x\} = 1 + x$

$$\Rightarrow \lim_{x \rightarrow 0^-} \frac{\cos^{-1}(1 - (1 + x)^2) \sin^{-1}(1 - (1 + x))}{(1 + x)(1 - (1 + x)^3)}$$

$$= \lim_{x \rightarrow 0^-} \frac{\cos^{-1}(-x^2 - 2x) \sin^{-1}(-x)}{(1 + x)(-x)(x^2 + 3x + 3)}$$

$$= \frac{\cos^{-1} 0}{1 \cdot 3} = \frac{\pi}{6}$$

$$\therefore \theta = \frac{\pi}{6} \Rightarrow \tan \theta = \frac{1}{\sqrt{3}}$$

## Question62

For  $a \neq 0$  and  $b \neq 0$ , if the real valued function  $f(x) = \frac{\sqrt[5]{a(625+x)} - 5}{\sqrt[4]{625+bx} - 5}$  is continuous at  $x = 0$ , then  $f(0) =$

Options:

A.

$$\frac{4b}{5}$$

B.

$$\frac{5b}{4}$$

C.

$$\frac{5}{4b}$$

D.

$$\frac{4}{5b}$$

**Answer: D**

**Solution:**

$\therefore f(x)$  is continuous at  $x = 0$

$$\therefore f(0) = \lim_{x \rightarrow 0} \frac{(a(625+x))^{1/5} - 5}{(625+bx)^{1/4} - 5}$$

at  $x = 0$

$$\frac{(625a)^{1/5} - 5}{0} \text{ (limit exist only when)}$$

$$(625a)^{1/5} - 5 = 0$$

$$\therefore a = 5)$$

Using L'Hospital rule,

$$\begin{aligned} f(0) &= \lim_{x \rightarrow 0} \frac{\frac{1}{5}(a(625+x)^{-4/5}) \cdot a}{\frac{1}{4}(625+bx)^{-3/4} \cdot b} \\ &= \frac{\frac{1}{5}(a \cdot 625)^{-4/5} a}{\frac{1}{4}(625)^{-3/4} b} = \frac{4}{5} \frac{(5^5)^{-4/5}}{(5^4)^{-3/4}} \cdot \frac{5}{b} \\ &= \frac{4 \cdot 5^{-4}}{5^{-3} \cdot b} = \frac{4}{5b} \end{aligned}$$

---

## Question63

If  $3^x y^x = x^{3y}$ , then the value of  $\frac{dy}{dx}$  at  $x = 1$  is

Options:

A.

-3

B.

3

C.

$-\frac{1}{3}$

D.

$\frac{1}{3}$

**Answer: D**

**Solution:**

$$3^x y^x = x^{3y} \quad \dots (i)$$

$$\text{At } x = 1 \Rightarrow 3y = 1 \Rightarrow y = \frac{1}{3}$$

Taking log both sides in Eq. (i), we get

$$\begin{aligned}\Rightarrow \log 3^x + \log y^x &= \log x^{3y} \\ \Rightarrow x \log 3 + x \log y &= 3y \log x\end{aligned}$$

Differential w.r.t.  $x$ , we get

$$\log 3 + \frac{x}{y} \frac{dy}{dx} + \log y = \frac{3y}{x} + 3 \log x \cdot \frac{dy}{dx}$$

$$\text{Put } x = 1, y = \frac{1}{3}.$$

$$\log 3 + 3 \frac{dy}{dx} + \log \frac{1}{3} = 3 \times \frac{1}{3} + 3 \log 1 \frac{dy}{dx}$$

$$\Rightarrow 3 \frac{dy}{dx} = 1$$

$$\Rightarrow \frac{dy}{dx} = \frac{1}{3}$$

---

## Question64

The value of  $x$  at which the real valued function  $f(x) = 7|2x + 1| - 19|3x - 5|$  is not differentiable is

Options:

A.

1,-1

B.

$\frac{1}{2}, -\frac{5}{3}$

C.

$-\frac{1}{2}, \frac{5}{3}$

D.

0,1

**Answer: C**

**Solution:**

$$f(x) = 7|2x + 1| - 19|3x - 5|$$
$$f(x) = \begin{cases} -7(2x + 1) + 19(3x - 5), & x < -\frac{1}{2} \\ 7(2x + 1) + 19(3x - 5), & -\frac{1}{2} \leq x < \frac{5}{3} \\ 7(2x + 1) - 19(3x - 5), & x \geq \frac{5}{3} \end{cases}$$

$$f(x) = \begin{cases} 43x - 102, & x \leq \frac{-1}{2} \\ 71x - 88, & -\frac{1}{2} \leq x < \frac{5}{3} \\ -43x + 102, & x \geq \frac{5}{3} \end{cases}$$

$$f'(x) = 43 \begin{cases} 43, & x < \frac{-1}{2} \\ 71, & -\frac{1}{2} < x < \frac{5}{3} \\ -43, & x > \frac{5}{3} \end{cases}$$

$\therefore f(x)$  is differentiable  $x = \frac{-1}{2}, \frac{5}{3}$

---

## Question65

If  $y = (1 - x^2) \tanh^{-1} x$ , then  $\frac{d^2y}{dx^2} =$

**Options:**

A.

$$\frac{2xy}{(1+x^2)^2}$$

B.

$$-\frac{(x+y)}{(1-x^2)^2}$$

C.

$$\frac{2(xy)}{1-x^2}$$

D.

$$-\frac{2(x+y)}{1-x^2}$$

**Answer: D**

**Solution:**

$$\begin{aligned}
 y &= (1 - x^2) \tanh^{-1} x \\
 \frac{dy}{dx} &= (1 - x^2) \cdot \frac{1}{1 - x^2} + \tanh^{-1} x (-2x) \\
 &= 1 - 2x \tanh^{-1}(x) \\
 \frac{d^2y}{dx^2} &= -2 \tanh^{-1} x - \frac{2x}{1 - x^2} \\
 &= -2 \frac{(1 - x^2) \tanh^{-1} x + x}{1 - x^2} \\
 &= -2 \frac{(y + x)}{1 - x^2}
 \end{aligned}$$

---

## Question66

If  $f(x) = \log_{(x^2-2x+1)}(x^2 - 3x + 2)$ ,  $x \in R - [1, 2]$  and  $x \neq 0$ , then  $f'(3) =$

**Options:**

A.

1

B.

0

C.

$\log_e 4$

D.

$\log_4 e$

**Answer: D**

**Solution:**

$$\begin{aligned}
 f(x) &= \log_{(x^2-2x+1)} x^2 - 3x + 2 \\
 &= \log_{(x-1)^2} (x-2)(x-1) \\
 &= \frac{1}{2} \log_{(x-1)} (x-2)(x-1) \\
 \Rightarrow f(x) &= \frac{1}{2} \left( 1 + \frac{\log(x-2)}{\log(x-1)} \right)
 \end{aligned}$$

$$\Rightarrow f'(x) = \frac{1}{2} \left( \frac{\log(x-1) \cdot \frac{1}{x-2}}{\frac{-\log(x-2) \cdot \frac{1}{(x-1)}}{(\log(x-1))^2}} \right)$$

$$\therefore f'(3) = \frac{\frac{1}{2} \left( \log 2 - \frac{\log 1}{2} \right)}{(\log 2)^2}$$

$$= \frac{1}{2 \log 2} = \frac{1}{\log 4} = \log_4 e$$

---

## Question 67

If the normal drawn at the point  $P$  on the curve  $y^2 = x^3 - x + 1$  makes equal intercepts on the coordinate axes, then the equation of the tangent drawn to the curve at  $P$  is

Options:

A.

$$x - y = 0$$

B.

$$x - y = 4$$

C.

$$x - y = 1$$

D.

$$x - y = 2$$

**Answer: A**

**Solution:**

$$y^2 = x^3 - x + 1$$

$$2y \frac{dy}{dx} = 3x^2 - 1$$

$$\frac{dy}{dx} = \frac{3x^2 - 1}{2y}$$

$$m_N = \frac{-1}{\frac{dy}{dx}} = \frac{-2y}{3x^2 - 1}$$

$\because$  Normal makes equal intercepts

$$\therefore m_N = \pm 1$$

$$\frac{-2y}{3x^2-1} = \pm 1$$

$$3x^2 - 1 = \pm 2y$$

$$9x^4 + 1 - 6x^2 = 4(x^3 - x + 1)$$

$$9x^4 - 4x^3 - 6x^2 + 4x - 3 = 0$$

$$\therefore x = 1$$

$$y = 1$$

$\therefore$  Tangent at  $P(1, 1)$

$$y - 1 = 1(x - 1)$$

$$\Rightarrow y = x$$

$$\Rightarrow x - y = 0$$

---

## Question68

If a balloon lying at an altitude of 30 m from an observed at a particular instant is moving horizontally. At the rate of 1 m/s away from him, then the rate at which the balloon is moving away directly from the observer at the 40 th second is (in m/s) .

Options:

A.

1.2

B.

0.9

C.

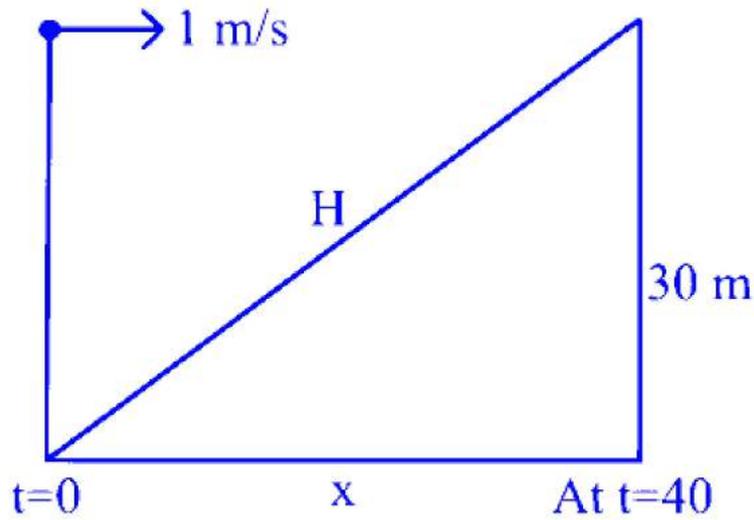

0.6

D.

0.8

**Answer: D**

**Solution:**

According to the question,

$$x^2 + (30)^2 = H^2$$

Differential w.r.t.  $t$ , we get

$$2x \frac{dx}{dt} = 2H \frac{dH}{dt}$$

$$\Rightarrow x \frac{dx}{dt} = H \frac{dH}{dt}$$

$$\therefore t = 40 \Rightarrow x = 40$$

$$\therefore H = \sqrt{30^2 + 40^2} = 50$$

$$\therefore 40 \times 1 = 50 \frac{dH}{dt}$$

$$\frac{dH}{dt} = \frac{4}{5} = 0.8 \text{ m/s}$$

## Question69

The approximate value of  $\sqrt{6560}$  is

Options:

A.

80.9939

B.

80.9838

C.

78.9939

D.

**Answer: A****Solution:**

$$\text{Let } y = \sqrt{x} \frac{dy}{dx} = \frac{1}{2\sqrt{x}}$$

$$\left. \frac{dy}{dx} \right|_{x=6561} = \frac{1}{2\sqrt{6561}} = \frac{1}{2 \times 81}$$

$$x_i = 6561$$

$$x_F = 6560, \Delta x = -1$$

$$\therefore \Delta y = \frac{dy}{dx}, \Delta x.$$

$$\sqrt{6560} - \sqrt{6561} = \frac{1}{2 \times 81} \times -1$$

$$\therefore \sqrt{6560} = 81 - \frac{1}{162}$$

$$= 81 - 0.00617 = 80.9939$$

## Question70

A real valued function  $f : [4, \infty) \rightarrow R$  is defined as

$f(x) = (x^2 + x + 1)^{(x^2 - 3x - 4)}$ , then  $f$  is

**Options:**

A.

monotonically decreasing function

B.

monotonically increasing function

C.

increasing in  $(4, 5)$  and decreasing in  $(5, \infty)$ 

D.

decreasing in  $(4, 5)$  and increasing in  $(5, \infty)$ **Answer: B****Solution:**

$$f(x) = (x^2 + x + 1)^{x^2 - 3x - 4}$$

$$\text{Let } g(x) = x^2 + x + 1, \quad h(x) = x^2 - 3x - 4$$

$$g'(x) = 2x + 1, \quad h'(x) = 2x - 3$$

$$\therefore x > 4$$

$$g'(x) > 0 \text{ and } h'(x) > 0$$

$\therefore$  both  $g(x)$  and  $h(x)$  are increasing

$\therefore f(x)$  is monotonically increasing function.

---

## Question 71

If a normal is drawn at a variable point  $P(x, y)$  on the curve  $9x^2 + 16y^2 - 144 = 0$ , then the maximum distance from the centre of the curve to the normal is

Options:

A.

1

B.

7

C.

12

D.

$\frac{3}{4}$

**Answer: A**

**Solution:**

$$9x^2 + 16y^2 = 144$$

$$\Rightarrow \frac{x^2}{16} + \frac{y^2}{9} = 1$$

Let point  $P$  on ellipse =  $P(4 \cos \theta, 3 \sin \theta)$

Normal at  $P$

$$\frac{4x}{\cos \theta} - \frac{3y}{\sin \theta} = 16 - 9$$

$$\Rightarrow \frac{4x}{\cos \theta} - \frac{3y}{\sin \theta} - 7 = 0$$

Distance from origin

$$D = \left| \frac{-7}{\sqrt{\frac{16}{\cos^2 \theta} + \frac{9}{\sin^2 \theta}}} \right|$$

$$= \left| \frac{-7}{\sqrt{16 \sec^2 \theta + 9 \operatorname{cosec}^2 \theta}} \right|$$

for maximum value of  $D$ ,  $P = 16 \sec^2 \theta + 9 \operatorname{cosec}^2 \theta$  will be minimum

$$\frac{dP}{d\theta} = 32 \sec^2 \theta \tan \theta - 18 \operatorname{cosec}^2 \theta \cot \theta = 0$$

$$\Rightarrow \frac{\sin \theta}{\cos^3 \theta} = \frac{18}{32} \cdot \frac{\cos \theta}{\sin^3 \theta}$$

$$\Rightarrow \frac{\sin^4 \theta}{\cos^4 \theta} = \frac{9}{16}$$

$$\Rightarrow \tan^2 \theta = \frac{3}{4} \Rightarrow \cot^2 \theta = \frac{4}{3}$$

$$\Rightarrow \sec^2 \theta = \frac{7}{4}, \operatorname{cosec}^2 \theta = \frac{7}{3}$$

$$D_{\max} = \frac{7}{\sqrt{16 \times \frac{7}{4} + 9 \times \frac{7}{3}}} = \frac{7}{\sqrt{49}} = 1$$

## Question 72

$$\int e^{-x} (x^3 - 2x^2 + 3x - 4) dx =$$

**Options:**

A.

$$-e^{-x} (x^3 - x^2 + 5x - 1) + C$$

B.

$$e^{-x} (x^3 - x^2 + 5x - 1) + C$$

C.

$$e^{-x} (x^3 + x^2 + 5x + 1) + C$$

D.

$$-e^{-x} (x^3 + x^2 + 5x + 1) + C$$

**Answer: D**

**Solution:**

$$I = \int e^{-x} (x^3 - 2x^2 + 3x - 4) dx$$

$$\text{Let } -x = t$$

$$-dx = dt$$

$$I = \int e^t (-t^3 - 2t^2 - 3t - 4)(-dt)$$

$$= \int e^t (t^3 + 2t^2 + 3t + 4) dt$$

$$= \int e^t (t^3 + 3t^2 - t^2 - 2t + 5t + 5 - 1) dt$$

$$= \int e^t (t^3 + 3t^2) dt + \int e^t (-t^2 - 2t) dt + \int e^t (5t + 5) dt - \int e^t dt$$

$$= e^t t^3 + e^t (-t^2) + e^t (5t) - e^t + C$$

$$= e^t (t^3 - t^2 + 5t - 1) + C$$

$$= e^{-x} (-x^3 - x^2 - 5x - 1) + C$$

$$= -e^{-x} (x^3 + x^2 + 5x + 1) + C$$

---

## Question 73

$$\int (1 + \tan^2 x)(1 + 2x \tan x) dx =$$

**Options:**

A.

$$x \sec x + C$$

B.

$$x \tan^2 x + C$$

C.

$$x \sec^2 x + C$$

D.

$$x \tan x + C$$

**Answer: C**

## Solution:

$$\begin{aligned} & \int (1 + \tan^2 x)(1 + 2x \tan x) dx \\ &= \int (\sec^2 x + 2x \tan x \sec^2 x) dx \\ &= \int \sec^2 x dx + \int \underset{I}{2x \tan x} \underset{II}{\sec^2 x} dx \\ &= \tan x + 2x \left( \frac{\tan^2 x}{2} \right) - \int \tan^2 x \cdot dx + C \\ &= \tan x + x \tan^2 x - \int (\sec^2 x - 1) dx + C \\ &= \tan x + x \tan^2 x - \tan x + x + C \\ &= x (\tan^2 x + 1) + C = x \sec^2 x + C \end{aligned}$$

---

## Question 74

$$\int \frac{x^2 \tan^{-1} x}{(1+x^2)^2} dx =$$

### Options:

A.

$$\frac{(\tan^{-1} x)^2}{4} - \frac{x \tan^{-1} x}{2(1+x^2)} + \frac{1-x^2}{4(1+x^2)} + C$$

B.

$$\frac{(\tan^{-1} x)^2}{4} - \frac{4x \tan^{-1} x + 1 - x^2}{8(1+x^2)} + C$$

C.

$$\frac{(\tan^{-1} x)^2}{4} - \frac{x \tan^{-1} x}{(1+x^2)} - \frac{1-x^2}{4(1+x^2)} + C$$

D.

$$\frac{(\tan x)^2}{4} + \frac{4x \tan^{-1} x - 1 + x^2}{4(1+x^2)} + C$$

**Answer: B**

## Solution:

$$I = \int x^2 \frac{\tan^{-1} x}{(1+x^2)^2} dx$$

$$\text{Put } x = \tan \theta \Rightarrow dx = \sec^2 \theta d\theta$$

$$\begin{aligned} I &= \int \tan^2 \theta \cdot \frac{\theta \cdot \sec^2 \theta d\theta}{\sec^4 \theta} \\ &= \int \theta \cdot \frac{\tan^2 \theta}{\sec^2 \theta} d\theta = \int \theta (\sin^2 \theta) d\theta \\ &= \int \theta \left( \frac{1 - \cos 2\theta}{2} \right) d\theta \\ &= \frac{1}{2} \int \theta (1 - \cos 2\theta) d\theta \\ &= \frac{1}{2} \int \theta d\theta - \int \theta \cos 2\theta d\theta \\ &= \frac{1}{2} \left( \frac{\theta^2}{2} - \frac{\theta \sin 2\theta}{2} - \frac{\cos 2\theta}{4} \right) + C \\ &= \frac{\theta^2}{4} - \frac{\theta}{4} \sin 2\theta - \frac{1}{8} \cos 2\theta + C \\ &= \frac{(\tan^{-1} x)^2}{4} - \frac{\tan^{-1} x}{4} \cdot \left( \frac{2x}{1+x^2} \right) - \frac{1}{8} \frac{1-x^2}{1+x^2} + C \\ &= \frac{(\tan^{-1} x)^2}{4} - \frac{4x \tan^{-1} x + 1 - x^2}{8(1+x^2)} + C \end{aligned}$$

---

## Question 75

$$\int \frac{\log x}{(1+x)^3} dx =$$

**Options:**

A.

$$\frac{1}{2} \left[ \frac{1}{1+x} + \frac{\log x}{(1+x)^2} - \log(x^2 + x) \right] + C$$

B.

$$\frac{1}{2} \left[ \frac{1}{1+x} - \frac{\log x}{(1+x)} - \log(1+x^2) \right] + C$$

C.

$$\frac{1}{2} \left[ \frac{1}{1+x} + \frac{\log x}{(1+x)^2} - \log(1+x^2) \right] + C$$

D.

$$\frac{1}{2} \left[ \frac{1}{1+x} - \frac{\log x}{(1+x)^2} + \log\left(\frac{x}{1+x}\right) \right] + C$$

**Answer: D**

**Solution:**

$$\begin{aligned} I &= \int \frac{\log x}{(1+x)^3} dx \\ &= \int_1^{\log x} \frac{1}{(1+x)^3} dx \\ \Rightarrow I &= \log x \int \frac{1}{(1+x)^3} dx - \int \left( \frac{1}{x} \cdot \int \frac{1}{(1+x)^3} dx \right) dx \\ &= \frac{\log x}{-2(1+x)^2} + \frac{1}{2} \int \frac{1}{x} \cdot \frac{1}{(1+x)^2} dx. \\ &= \frac{1}{2} \left( \frac{-\log x}{(1+x)^2} \right) + \frac{1}{2} \int \left( \frac{1}{x} - \frac{1}{1+x} - \frac{1}{(1+x)^2} \right) dx \\ &= \frac{1}{2} \left( \frac{-\log x}{(1+x)^2} + \log x - \log(1+x) + \frac{1}{x+1} \right) + C \\ &= \frac{1}{2} \left( \frac{1}{1+x} - \frac{\log x}{(1+x)^2} + \log \left( \frac{x}{1+x} \right) \right) + C \end{aligned}$$

---

## Question 76

$$\int_0^{\pi/4} \frac{1}{5 \cos^2 x + 16 \sin^2 x + 8 \sin x \cos x} dx =$$

**Options:**

A.

$$\tan^{-1} \left( \frac{4}{5} \right)$$

B.

$$2 \tan^{-1} \left( \frac{3}{5} \right)$$

C.

$$\frac{1}{8} \tan^{-1} \left( \frac{8}{9} \right)$$

D.

$$\frac{1}{4} \tan^{-1} \left( \frac{7}{8} \right)$$

**Answer: C**

**Solution:**

$$I = \int_0^{\pi/4} \frac{dx}{5 \cos^2 x + 16 \sin^2 x + 8 \sin x \cos x}$$

$$= \int_0^{\pi/4} \frac{\sec^2 x dx}{5 + 16 \tan^2 x + 8 \tan x}$$

Put,  $\tan x = t \Rightarrow \sec^2 x dx = dt$

$$I = \int_0^1 \frac{dt}{16t^2 + 8t + 5}$$

$$= \frac{1}{16} \int_0^1 \frac{dt}{t^2 + \frac{1}{2}t + \frac{5}{16}}$$

$$= \frac{1}{16} \int_0^1 \frac{dt}{\left(t + \frac{1}{4}\right)^2 + \frac{5}{16} - \frac{1}{16}}$$

$$= \frac{1}{16} \int_0^1 \frac{dt}{\left(t + \frac{1}{4}\right)^2 + \left(\frac{1}{2}\right)^2}$$

$$= \frac{1}{16} \times \frac{1}{\frac{1}{2}} \tan^{-1} \left( \frac{t + \frac{1}{4}}{\frac{1}{2}} \right) \Big|_0^1$$

$$= \frac{1}{8} \left[ \tan^{-1} \left( \frac{\frac{5}{2}}{2} \right) - \tan^{-1} \left( \frac{1}{2} \right) \right]$$

$$= \frac{1}{8} \tan^{-1} \left( \frac{\frac{5}{2} - \frac{1}{2}}{1 + \frac{5}{4}} \right) = \frac{1}{8} \tan^{-1} \left( \frac{8}{9} \right)$$

## Question 77

$$\int_8^{18} \frac{1}{(x+2)\sqrt{x-3}} dx =$$

**Options:**

A.

$$\frac{\pi}{6\sqrt{5}}$$

B.

$$\frac{\pi}{6}$$

C.

$$\frac{\pi}{3}$$

D.

$$\frac{\pi}{3\sqrt{5}}$$

**Answer: A**

## Solution:

$$I = \int_8^{18} \frac{1}{(x+2)\sqrt{x-3}} dx$$

Put  $x - 3 = t^2$

$$dx = 2t dt$$

$$\begin{aligned} I &= \int_{\sqrt{5}}^{\sqrt{15}} \frac{2dt}{(t^2 + 5) \cdot t} = 2 \int_{\sqrt{5}}^{\sqrt{15}} \frac{dt}{t^2 + 5} \\ &= \frac{2}{\sqrt{5}} \left( \tan^{-1} \frac{t}{\sqrt{5}} \right)_{\sqrt{5}}^{\sqrt{15}} \\ &= \frac{2}{\sqrt{5}} \left( \frac{\pi}{3} - \frac{\pi}{4} \right) = \frac{2}{\sqrt{5}} \left( \frac{\pi}{12} \right) = \frac{\pi}{6\sqrt{5}} \end{aligned}$$

---

## Question78

If  $[.]$  denotes the greatest integer function, then  $\int_1^2 [x^2] dx =$

Options:

A.

$$5 + \sqrt{2} + \sqrt{3}$$

B.

$$5 + \sqrt{2} - \sqrt{3}$$

C.

$$5 - \sqrt{2} - \sqrt{3}$$

D.

$$5 - \sqrt{2} + \sqrt{3}$$

**Answer: C**

**Solution:**

$$\begin{aligned}
I &= \int_1^2 [x^2] dx \\
&= \int_1^{\sqrt{2}} 1 dx + \int_{\sqrt{2}}^{\sqrt{3}} 2 dx + \int_{\sqrt{3}}^2 3 dx \\
&= (\sqrt{2} - 1) + 2(\sqrt{3} - \sqrt{2}) + 3(2 - \sqrt{3}) \\
&= \sqrt{2} - 1 + 2\sqrt{3} - 2\sqrt{2} + 6 - 3\sqrt{3} \\
&= 5 - \sqrt{2} - \sqrt{3}
\end{aligned}$$

---

## Question 79

The differential equation of a family of hyperbolas whose axes are parallel to coordinate axes, centres lie on the line  $y = 2x$  and eccentricity is  $\sqrt{3}$  is

Options:

A.

$$(2x - y)y_2 + y_1^2 - 2y_1 = y_1^3 + 2$$

B.

$$(y - 2x)y_2 + y_1^2 + 2y_1 = y_1^3 + 2$$

C.

$$(y - 2x)y_2 - y_1^2 + 2y_1 = y_1^3 - 2$$

D.

$$(y + 2x)y_2 + y_1^2 + 2y_1 = y_1^3 - 2$$

**Answer: B**

**Solution:**

Let centre  $(h, k)$  lies on  $y = 2x$

$$\Rightarrow k = 2h$$

$$\therefore \frac{(x-h)^2}{a^2} - \frac{(y-2h)^2}{b^2} = 1$$

$$\Rightarrow \frac{(x-h)^2}{a^2} - \frac{(y-2h)^2}{2a^2} = 1$$

$$\left[ \because e = \sqrt{3} \Rightarrow b^2 = 2a^2 \right]$$

On differentiating w.r.t.  $x$ , we get

$$4(x - h) - 2(y - 2h) \frac{dy}{dx} = 0$$

$$\Rightarrow (y - 2h)y_1 = 2(x - h) \quad \dots (i)$$

Again, differentiating,

$$(y - 2h)y_2 = 2 - y_1^2$$

From Eq. (i),  $h = \frac{2x - yy_1}{2(1 - y_1)}$

$\therefore$  Differentiating equation is

$$\left( y - 2 \left( \frac{2x - yy_1}{2(1 - y_1)} \right) \right) y_2 = 2 - y_1^2$$

$$\Rightarrow (y - yy_1 - 2x + yy_1)y_2 = 2 + y_1^3 - 2y_1 - y_1^2$$

$$\Rightarrow (y - 2x)y_2 + y_1^2 + 2y_1 = y_1^3 + 2$$

## Question80

The general solution of the differential equation  $(x^3 - y^3)dx = (x^2y - xy^2)dy$  is

**Options:**

A.

$$y = x \log(c|x + y|)$$

B.

$$y = \log(c|x + y|)$$

C.

$$xy = \log(c|x + y|)$$

D.

$$x + y + \log|x + y|c = 0$$

**Answer: A**

**Solution:**

Given,  $(x^3 - y^3)dx = (x^2y - xy^2)dy$

$$\frac{dy}{dx} = \frac{x^3 - y^3}{x^2y - xy^2}$$

$$\frac{dy}{dx} = \frac{x^2 + xy + y^2}{xy}$$

Homogeneous differential equation

Put  $y = vx$

$$\frac{dy}{dx} = v + x \frac{dv}{dx}$$

$$\Rightarrow v + \frac{xdv}{dx} = \frac{1 + v + v^2}{v}$$

$$\Rightarrow x \frac{dv}{dx} = \frac{1 + v}{v}$$

$$\Rightarrow \frac{v}{v+1} dv = \frac{dx}{x}$$

$$\Rightarrow \frac{v+1-1}{v+1} dv = \frac{dx}{x}$$

On taking integration both sides, we get

$$\int \frac{v+1}{v+1} dv - \int \frac{1}{v+1} dv = \int \frac{dx}{x}$$

$$v - \ln|v+1| = \ln x + \ln c$$

$$\Rightarrow v = \ln|x(v+1)c|$$

$$\Rightarrow \frac{y}{x} = \log[(y+x)c]$$

$$\Rightarrow y = x \log(c|x+y|)$$

## Chemistry

### Question 1

The energy associated with electron in first orbit of hydrogen atom is  $-2.18 \times 10^{-18}$  J. The frequency of the light required (in Hz) to excite the electron to fifth orbit is ( $h = 6.6 \times 10^{-34}$  Js)

Options:

A.

$$2.17 \times 10^{16}$$

B.

$$3.17 \times 10^{14}$$

C.

$$2.17 \times 10^{15}$$

D.

$$3.17 \times 10^{15}$$

**Answer: D**

**Solution:**

Energy in the  $n$ th orbit is given by

$$E_n = \frac{E_1}{n^2}$$

For  $n = 5$ ,

$$\begin{aligned} E_5 &= \frac{-2.18 \times 10^{-18} \text{ J}}{(5^2)} \\ &= -8.72 \times 10^{-20} \text{ J} \\ \Delta E &= E_5 - E_1 \\ &= (-8.72 \times 10^{-20}) - (-2.18 \times 10^{-18}) \\ &= 2.0928 \times 10^{-18} \text{ J} \\ v &= \frac{\Delta E}{h} = \frac{2.0928 \times 10^{-18}}{6.6 \times 10^{-34}} \\ &= 3.17 \times 10^{15} \text{ Hz} \end{aligned}$$

---

## Question2

**In Sr ( $Z = 38$ ), the number of electrons with  $l = 0$  is  $x$ , number of electrons with  $l = 2$  is  $y$ .  $(x - y)$  is equal to ( $l = \text{Azimuthal quantum number}$ )**

**Options:**

A.

0

B.

8

C.

-2

D.

**Answer: A**

## Solution:

**Step 1: Write the electron configuration of Strontium (Sr,  $Z = 38$ )**

**Step 2: Count electrons with  $l = 0$**

Electrons with  $l = 0$  are in  $s$  orbitals. Add up all the electrons in  $s$  orbitals:

$$x = 2(1s) + 2(2s) + 2(3s) + 2(4s) + 2(5s) = 10 \text{ So, } x = 10$$

**Step 3: Count electrons with  $l = 2$**

Electrons with  $l = 2$  are in  $d$  orbitals. Look for the  $d$  orbital electrons:  $y = 10$  (from  $3d^{10}$ ) So,  $y = 10$

**Step 4: Find  $x - y$**

$$\text{Subtract to get: } x - y = 10 - 10 = 0$$

**Step 5: Find  $y \cdot (x - y)$**

$$\text{Multiply } y \text{ and } x - y: y \cdot (x - y) = 10 \times 0 = 0$$

## Question3

Match the following.

List-I (Element)		List-II ( $\Delta_{eg}H$ ) (in $\text{kJmol}^{-1}$ )	
A.	O	I.	-200
B.	F	II.	-349
C.	Cl	III.	-141
D.	S	IV.	-328
		V.	+48

**The correct answer is**

**Options:**

A.

A-II, B-IV, C-I, D-III

B.

A-V, B-IV, C-II, D-I

C.

A-III, B-IV, C-II, D-I

D.

A-III, B-II, C-IV, D-I

**Answer: C**

## Solution:

Let's determine the electron gain enthalpies for the given elements based on periodic trends and known values. Electron gain enthalpy ( $\Delta_{eg}H$ ) is the energy change when an electron is added to a neutral gaseous atom. A more negative value indicates a greater tendency to accept an electron (more exothermic process).

### General Trends:

- Group 17 (Halogens) have the most negative electron gain enthalpies.** Among halogens, chlorine (Cl) generally has a more negative electron gain enthalpy than fluorine (F) because F's small size leads to significant interelectronic repulsion when an incoming electron is added, making it less favorable than Cl.
  - **Chlorine (Cl):** Expect a very large negative value.
  - **Fluorine (F):** Expect a large negative value, but slightly less negative than Cl.
- Group 16 (Chalcogens) also have negative electron gain enthalpies.** Similar to halogens, sulfur (S) generally has a more negative electron gain enthalpy than oxygen (O) due to O's small size and resulting interelectronic repulsion.
  - **Sulfur (S):** Expect a negative value.
  - **Oxygen (O):** Expect a negative value, but less negative than S.

Let's examine the provided values in List-II:

I.  $-200 \text{ kJmol}^{-1}$

II.  $-349 \text{ kJmol}^{-1}$

III.  $-141 \text{ kJmol}^{-1}$

IV.  $-328 \text{ kJmol}^{-1}$

V.  $+48 \text{ kJmol}^{-1}$  (This is a positive value, meaning energy is required to add an electron, which is characteristic of elements like noble gases or alkaline earth metals, but not O, F, Cl, S for the first electron gain).

Now let's match the elements:

- Chlorine (Cl):** It is known to have the most negative electron gain enthalpy among all elements. Among the given negative values,  $-349 \text{ kJmol}^{-1}$  is the most negative.
  - So, **C (Cl)  $\rightarrow$  II ( $-349 \text{ kJmol}^{-1}$ ).**

2. **Fluorine (F):** It has a very large negative electron gain enthalpy, but due to its smaller size and interelectronic repulsion, it's slightly less exothermic than Cl. The second most negative value is  $-328 \text{ kJmol}^{-1}$ .
- So, **B (F) → IV (-328 kJmol<sup>-1</sup>)**.
3. **Sulfur (S):** Belonging to Group 16, its electron gain enthalpy is exothermic, and it should be more negative than Oxygen. Comparing the remaining negative values ( $-200$  and  $-141$ ),  $-200 \text{ kJmol}^{-1}$  is more negative.
- So, **D (S) → I (-200 kJmol<sup>-1</sup>)**.
4. **Oxygen (O):** Also in Group 16, its small size leads to interelectronic repulsion, making its electron gain enthalpy less negative (less exothermic) than that of Sulfur. The remaining negative value is  $-141 \text{ kJmol}^{-1}$ .
- So, **A (O) → III (-141 kJmol<sup>-1</sup>)**.

Let's summarize the matching:

- A (O) → III ( $-141 \text{ kJmol}^{-1}$ )
- B (F) → IV ( $-328 \text{ kJmol}^{-1}$ )
- C (Cl) → II ( $-349 \text{ kJmol}^{-1}$ )
- D (S) → I ( $-200 \text{ kJmol}^{-1}$ )

Comparing this with the given options:

Option C: A-III, B-IV, C-II, D-I

This matches our derived assignments.

The final answer is Option C

## Question4

**Observe the following data (  $\Delta_t H_1$ ,  $\Delta_t H_2$  and  $\Delta_{eg} H$  represent the first, second ionisation enthalpies and electron gain enthalpy respectively)**

Element	$\Delta_t H_1$ ( $\text{kJmol}^{-1}$ )	$\Delta_t H_2$ ( $\text{kJmol}^{-1}$ )	$\Delta_{eg} H$ ( $\text{kJmol}^{-1}$ )
I	520	7300	-60
II	490	3051	-48
III	1681	3374	-328
IV	2372	5251	+48

**Using the data identify the most reactive metal.**

**Options:**

A.

II

B.

I

C.

IV

D.

III

**Answer: A**

**Solution:**

Among the given elements, element II is most reactive metals.

The reason is that, it has low 1st ionisation enthalpy, high 2nd ionisation enthalpy and low electron gain enthalpy.

---

## **Question5**

**The sum of bond order of  $O_2^+$ ,  $O_2^-$ ,  $O_2$  and  $O_2^{2+}$  is equal to**

**Options:**

A.

5

B.

4

C.

6

D.

**Answer: D**

**Solution:**

Bond order

$$= \frac{\text{Bonding electrons} - \text{Non-bonding electrons}}{2}$$

$$\text{B.O. of } \text{O}_2 = \frac{1}{2}[10 - 6] = 2$$

$$\text{O}_2^+ = \frac{1}{2}[10 - 5] = 2.5$$

$$\text{O}_2^- = \frac{1}{2}(10 - 7) = 1.5$$

$$\text{O}_2^{2+} = \frac{1}{2}(10 - 4) = 3$$

Sum of B.O. of  $\text{O}_2$ ,  $\text{O}_2^+$ ,  $\text{O}_2^-$  and  $\text{O}_2^{2+}$

$$= 2 + 2.5 + 1.5 + 3 = 9$$

## Question 6

**Observe the following statements**

**Statement-I Hybridisation is not same in both  $\text{SF}_6$  and  $\text{BrF}_5$ .**

**Statement-II  $\text{BrF}_5$  is square pyramidal while  $\text{SF}_6$  is octahedral in shape.**

**The correct answer is**

**Options:**

A.

Both statement I and II are correct.

B.

Statement I is correct, but statement II is not correct.

C.

Statement I is not correct, but statement II is correct.

D.

Both statement I and II are not correct.

**Answer: C**

**Solution:**

Statement I is not correct but statement II is correct. The correct form of statement I is,

Both  $\text{SF}_6$  and  $\text{BrF}_5$  has same hybridisation i.e.,  $sp^3d^2$ .

---

## Question7

At  $T$  ( K ) root mean square (rms) velocity of argon (molar mass  $40 \text{ g mol}^{-1}$  ) is  $20 \text{ ms}^{-1}$  . The average kinetic energy of the same gas at  $T$  ( K ) (in  $\text{J mol}^{-1}$  ) is

**Options:**

A.

8

B.

16

C.

4

D.

2

**Answer: A**

**Solution:**

The root mean square (rms) speed of argon gas is given as  $20 \text{ ms}^{-1}$ .

The molar mass of argon is  $40 \text{ g mol}^{-1}$ . This can also be written as  $0.040 \text{ kg mol}^{-1}$  (because  $1000 \text{ g} = 1 \text{ kg}$ ).

The formula for average kinetic energy per mole of a gas is:  $E = \frac{1}{2} M v_{\text{rms}}^2$ , where  $M$  is the molar mass in  $\text{kg/mol}$  and  $v_{\text{rms}}$  is the rms speed.

Substitute the values:

$$E = \frac{1}{2} \times 0.040 \times (20)^2$$

Calculate  $(20)^2 = 400$ , so:

$$E = \frac{1}{2} \times 0.040 \times 400$$

$$\frac{1}{2} \times 0.040 = 0.020, \text{ so:}$$

$$E = 0.020 \times 400 = 8$$

So, the average kinetic energy per mole of argon is  $8 \text{ J mol}^{-1}$  at this temperature.

-----

## Question8

**4.0 g of a mixture containing  $\text{Na}_2\text{CO}_3$  and  $\text{NaHCO}_3$  is heated to 673 K . Loss in mass of the mixture is found to be 0.62 g . The percentage of sodium carbonate in the mixture is**

**Options:**

A.

42

B.

58

C.

48

D.

52

**Answer: B**

**Solution:**

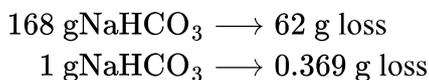

The decomposition reaction is,

Total mass of mixture = 4 g

Mass loss = 0.62 g

From reaction

Let  $x$  = mass of  $\text{NaHCO}_3$

$$x = \frac{168}{62} \times 0.62 = 1.68 \text{ g}$$

$$\text{Mass of NaCO}_3 = 4.0 - 1.68 = 2.32 \text{ g}$$

$$\% \text{Na}_2\text{CO}_3 = \frac{2.32}{4.0} \times 100 = 58\%$$

---

## Question9

At 298 K , if the standard Gibbs energy change  $\Delta_r G^\circ$  of a reaction is -115 kJ , the value of  $\log_{10} K_p$  will be  $\left( R = 8.314 \text{ JK}^{-1} \text{ mol}^{-1} \right)$

Options:

A.

+20.15

B.

-20.15

C.

-10.30

D.

+10.30

**Answer: A**

**Solution:**

Gibbs' free energy is given by

$$\Delta G^\circ = -RT \ln(K)$$
$$\Rightarrow -115000 \text{ J} = -8.314 \times 298 \times \ln K_p$$
$$\Rightarrow \log_{10} (K_p) = \frac{46.42}{2.303}$$
$$\log_{10} (K_p) = +20.15$$

---

## Question10

200 mL of an aqueous solution of HCl(pH = 2) is mixed with 300 mL of aqueous solution of NaOH (pH = 12) and is diluted to 1.0 L . The pH of the resulting solution is ( pH = 2 )

Options:

A.

10.3

B.

11.0

C.

11.3

D.

11.7

**Answer: B**

**Solution:**

For HCl,  $[H^+] = 10^{-pH}$ ,

HCl =  $10^{-2}M$

For NaOH ,

$[OH^-] = 10^{-pOH}$ , NaOH =  $10^{-2}M$

$$\begin{aligned} \text{Moles of } H^+ &= [H^+] \times V_{HCl} = 10^{-2} \times 0.2 \\ &= 0.002 \text{ mol} \end{aligned}$$

$$\begin{aligned} \text{Moles of } OH^- &= [OH^-] \times V_{NaOH} \\ &= 10^{-2} \times 0.300 = 0.003 \text{ mol} \end{aligned}$$

Moles of  $OH^-$  remaining

$$\begin{aligned} &= \text{Moles of OH}^- - \text{Moles of H}^+ \\ &= 0.003 - 0.002 = 0.001 \text{ mol} \end{aligned}$$

$$[\text{OH}^-]_{\text{final}} = \frac{\text{Moles of OH}^- \text{ remaining}}{V_{\text{final}}}$$

$$= \frac{0.001}{1} = 0.001\text{M}$$

$$\text{pOH} = -\log [\text{OH}^-]_{\text{final}} = -\log(0.001) = 3$$

$$\text{pH} = 14 - \text{pOH} = 14 - 3 = 11$$

---

## Question11

Identify the electron rich hydrides from the following

Options:

A.

B.

C.

D.

**Answer: C**

**Solution:**

Among the given options, HCl and  $\text{H}_2\text{S}$  are electron rich hydrides. Electron rich hydrides are those compounds where the central atom has more electron than required to form single covalent bonds with its surrounding atoms.

---

## Question12

The incorrect statement about Castner-kellner cell process is

Options:

A.

sodium hydroxide is prepared.

B.

brine solution is the electrolyte.

C.

mercury acts as anode and carbon rod acts as cathode.

D.

chlorine gas liberates at anode.

**Answer: C**

**Solution:**

Statement given in option (c) is incorrect about Castner-Kellner cell process. It's correct form is, mercury acts as cathode and carbon rod acts as anode.

---

## Question13

**The incorrect statement about Castner-kellner cell process is**

**Options:**

A.

sodium hydroxide is prepared.

B.

brine solution is the electrolyte.

C.

mercury acts as anode and carbon rod acts as cathode.

D.

chlorine gas liberates at anode.

**Answer: C**

**Solution:**

The Castner-Kellner cell process is an electrolytic method for the industrial production of sodium hydroxide, chlorine, and hydrogen from brine. Let's evaluate each statement:

- **Option A: sodium hydroxide is prepared.**

In the Castner-Kellner cell, sodium ions are reduced at the mercury cathode to form sodium amalgam. This amalgam is then reacted with water in a separate decomposer unit to produce sodium hydroxide (NaOH) and hydrogen gas. So, this statement is **correct**.

- **Option B: brine solution is the electrolyte.**

The cell uses an aqueous solution of sodium chloride (NaCl), which is commonly known as brine, as the electrolyte. So, this statement is **correct**.

- **Option C: mercury acts as anode and carbon rod acts as cathode.**

In the Castner-Kellner cell:

- **Anode:** Graphite (carbon) rods are used as the anode, where chloride ions are oxidized to chlorine gas ( $2\text{Cl}^-(\text{aq}) \rightarrow \text{Cl}_2(\text{g}) + 2\text{e}^-$ ).
- **Cathode:** A flowing layer of mercury acts as the cathode, where sodium ions are reduced to form sodium amalgam ( $\text{Na}^+(\text{aq}) + \text{e}^- \rightarrow \text{Na}(\text{in Hg})$ ).

Therefore, the statement that mercury acts as the anode and carbon rod acts as the cathode is **incorrect**. The roles are reversed.

- **Option D: chlorine gas liberates at anode.**

As mentioned above, at the graphite anode, chloride ions are oxidized to produce chlorine gas. So, this statement is **correct**.

The incorrect statement is C.

The final answer is  C

---

## Question 14

**Which of the following is an incorrect statement about the compounds of group 13 elements?**

**Options:**

A.

All the trihalides exist except  $\text{TII}_3$ .

B.

Trihalides on hydrolysis form tetrahedral species.

C.

Diborane is an example of electron precise hydride.

D.

Hydrolysis of diborane gives boric acid.

**Answer: C**

**Solution:**

Among the given statements, statement given in option (c) is incorrect about compounds of group 13 elements. It's correct form is, Diborane ( $B_2H_6$ ) is an example of electron deficient hydride.

---

## Question15

**The incorrect statement about the oxidation states of group 14 elements is**

**Options:**

A.

In addition to +4, +2 carbon also shows negative oxidation states.

B.

Tin in +2 state acts as a reducing agent.

C.

Lead in +2 state acts as good reducing agent.

D.

Lead in +4 state acts as a good oxidising agent.

**Answer: C**

**Solution:**

Among the given statements, statement given in option (c) is incorrect about oxidation state of group 14 elements, it's correct form is lead in +2 state is not a good reducing agent. This is because it readily accepts two more electrons to achieve the stable +4 oxidation state.

---

## Question16

In drinking water, if the maximum prescribed concentration of copper is  $x \text{ mg dm}^{-3}$ , the maximum prescribed concentration of zinc will be

Options:

A.

$$\frac{15}{x}$$

B.

$$\frac{x}{15}$$

C.

$$\frac{6}{10}x$$

D.

$$\frac{5}{6}x$$

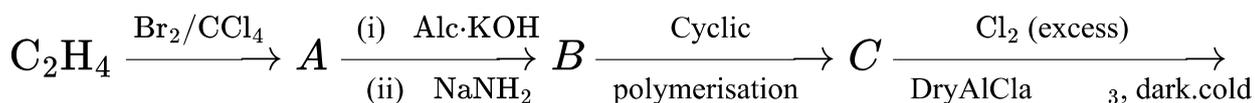

Answer: A

Solution:

The maximum prescribed concentration of zinc in drinking water is  $15 \text{ mg dm}^{-3}$ . The maximum prescribed concentrations of copper is  $1 \text{ mg dm}^{-3}$ . Thus, the correct option is  $\frac{15}{x}$ .

## Question 17

The empirical formula of the compound 'D' formed in the given reaction sequence is

Options:

A.

CHCl

B.

CCl

C.

CH<sub>2</sub>Cl

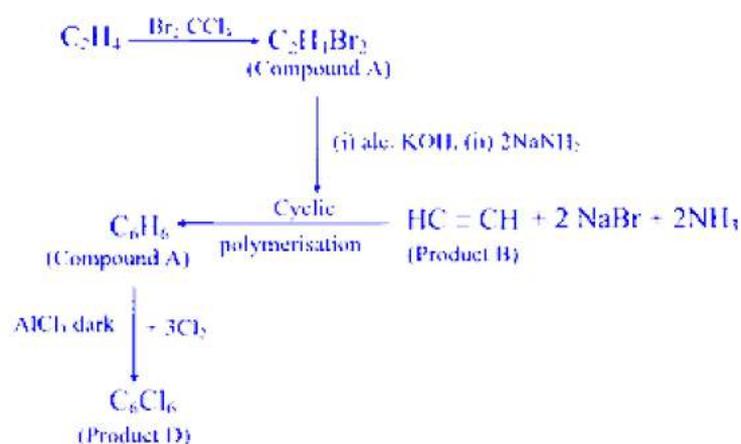

D.

CHCl<sub>2</sub>

**Answer: B**

**Solution:**

The complete reaction mechanism is, as follows,

C<sub>6</sub>Cl<sub>6</sub> is the molecular formula of product D. Thus, its, empirical formula is CCl.

---

## Question18

**Which one of the following mixtures can be separated by steam distillation technique?**

**Options:**

A.

*n*-Hexane + *n*-Heptane

B.

CHCl<sub>3</sub> + Aniline

C.

Aniline + H<sub>2</sub>O

D.

Glucose + NaCl

**Answer: C**

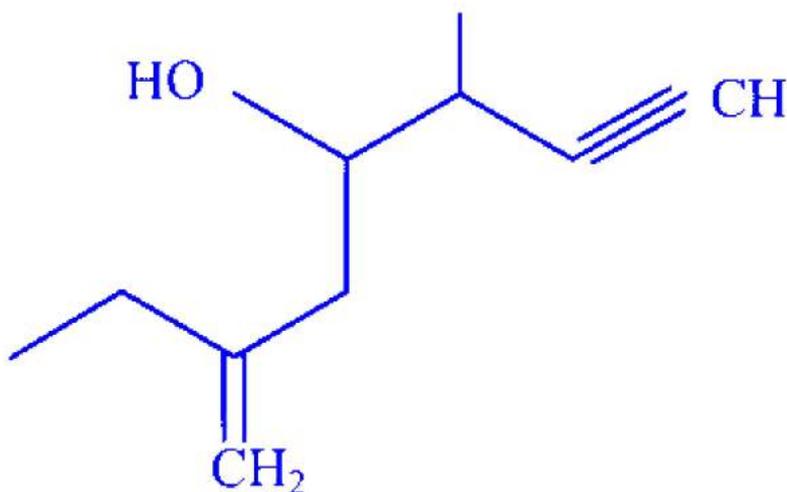

**Solution:**

Aniline and H<sub>2</sub>O can be separated by using steam distillation. They have different boiling point, thus can be separated by using vapour formation.

---

## Question19

The IUPAC name of the following compound is

**Options:**

A.

3-methenyl-6-methyloct -7-yn-5-ol

B.

2-ethyl-5-methylhept -1-en-6-yn-4-ol

C.

2-ethyl-5-methylhept-1-yn-6-en-4-ol

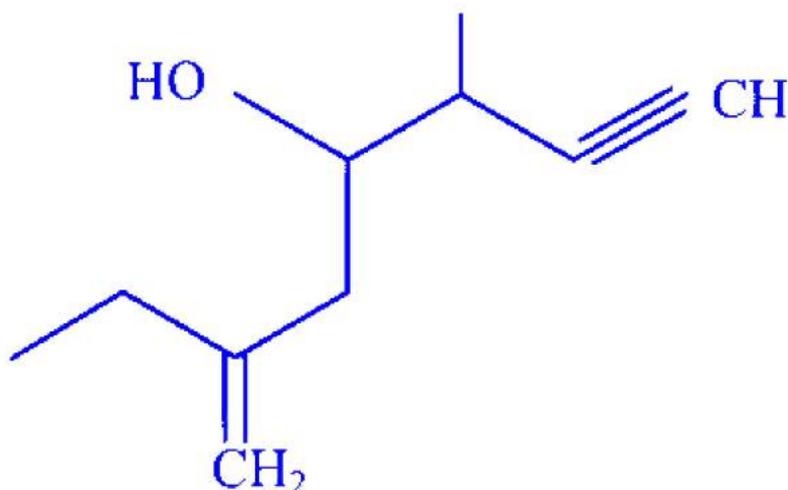

D.

3-methyl-6-ethylhept-6-en-1-yn-4-ol

**Answer: B**

## Solution:

The correct IUPAC name of

2-ethyl-5-methylhept-1-en-6-yn-4-ol

---

## Question20

An alkyne has the molecular formula  $C_6H_{10}$ . The number of 1-alkyne isomers (excluding stereoisomers) possible for it is

Options:

A.

2

B.

5

C.

3

D.

4

**Answer: D**

## Solution:

The number of 1-alkyne isomer possible for the compound with the molecular formula  $C_6H_{10}$  is 4 . This are as follows,

(1-hexyne)

(3-methyl-1-pentyne)

(4-methyl-1-pentyne)

(3,3-dimethyl-1-butyne)

Thus, 4 isomers are possible.

---

## Question21

A metal crystallises in two cubic phases, fcc and bcc with edge lengths  $3.5\overset{\circ}{\text{Å}}$  and  $3\overset{\circ}{\text{Å}}$  respectively. The ratio of densities of fcc and bcc is approximately

Options:

A.

1.36

B.

1.26

C.

2.16

D.

6.13

**Answer: B**

**Solution:**

$$\text{Density } (d) = \frac{Z \times M}{N_A \times a^3}$$

Ratio of density of fcc and bcc,

$$\frac{d_{fcc}}{d_{bcc}} = \frac{Z_{fcc} \times a_{bcc}^3}{Z_{bcc} \times a_{fcc}^3}$$

$$\Rightarrow \frac{d_{fcc}}{d_{bcc}} = \frac{4}{2} \times \left(\frac{3}{3.5}\right)^3$$

$$\approx 1.26$$

---

## Question22

Observe the following data given in the table ( $K_H$  = Henry's law constant)

Gas	CO <sub>2</sub>	Ar	HCHO	CH <sub>4</sub>
( $K_H$ bar at <b>298 K</b> )	1.67	40.3	$1.83 \times 10^{-5}$	0.413

The correct order of their solubility in water is

**Options:**

A.

CO<sub>2</sub> > CH<sub>4</sub> > HCHO > Ar

B.

Ar > HCHO > CH<sub>4</sub> > CO<sub>2</sub>

C.

HCHO > CH<sub>4</sub> > CO<sub>2</sub> > Ar

D.

CO<sub>2</sub> > HCHO > CH<sub>4</sub> > Ar

**Answer: C**

**Solution:**

Using Henry's law,

Solubility of gas in liquid  $\propto \frac{1}{K_H}$

Lower the value of  $K_H$ , higher will be the solubility.

Thus, the correct order of solubility is

HCHO > CH<sub>4</sub> > CO<sub>2</sub> > Ar

## Question23

The Gibbs energy change of the reaction (in  $\text{kJmol}^{-1}$ ) corresponding to the following cell

(Given  $E_{\text{Cr}^{3+}|\text{Cr}}^{\circ} = -0.75 \text{ V}$ ;  $E_{\text{Fe}^{2+}|\text{Fe}}^{\circ} = -0.45 \text{ V}$ ,

$1\text{F} = 96,500\text{Cmol}^{-1}$ )

Options:

A.

-150.9

B.

-173.7

C.

+150.9

D.

+173.7

**Answer: A**

**Solution:**

$$\begin{aligned} E_{\text{cell}}^{\circ} &= E_{\text{cathode}}^{\circ} - E_{\text{anode}}^{\circ} \\ &= (-0.45) + (0.75) = 0.30 \text{ V} \end{aligned}$$

For the reaction:

$$Q = \frac{[\text{Cr}^{3+}]^2}{[\text{Fe}^{2+}]^3} = \frac{(0.1)^2}{(0.001)^2} = 10^4$$

$$\begin{aligned} E_{\text{cell}} &= 0.30 - \frac{0.059}{6} \log 10^4 \\ &= 0.30 - \frac{0.059}{6} \times 4 \\ &\approx 0.2607 \text{ V} \end{aligned}$$

Gibb's free energy,

$$\begin{aligned} \Delta G^\circ &= -nFE^\circ \\ &= 6 \times 96500 \times 0.2607 \times 10^{-3} \\ &= -150.9 \text{ kJ/mol} \end{aligned}$$

---

## Question24

**For a first order decomposition of a certain reaction, rate constant is given by the equation.  $\log k (s^{-1}) = 7.14 - \frac{1 \times 10^4 \text{ K}}{T}$ . The activation energy of the reaction ( in  $\text{kJmol}^{-1}$  ) is**

$$\left( R = 8.3 \text{ JK}^{-1} \text{ mol}^{-1} \right)$$

**Options:**

A.

161.1

B.

171.1

C.

181.1

D.

191.1

**Answer: D**

**Solution:**

$$\text{Given, } \log K (s^{-1}) = 7.14 - 1 \times 10^4 K$$

$$R = 8.3 \text{ JK}^{-1} \text{ mol}^{-1} \text{ T}$$

$$E_a = ?$$

Using Arrhenius equation,

$$\log k = \log A - \frac{E_a}{2.303RT}$$

$$\text{Comparing } \frac{E_a}{2.303R} = 1 \times 10^4$$

$$\text{Calculating; } E_a = 2.303 \times R \times 1 \times 10^4$$

$$= 191.47$$

$$\approx 191.1 \text{ kJ/mol}$$

---

## Question 25

The source of an enzyme is malt and that enzyme converts  $X$  into  $Y$ .  $X$  and  $Y$  respectively are

**Options:**

A.

starch, maltose

B.

maltose, glucose

C.

proteins, peptides

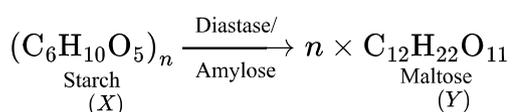

D.

glucose, fructose

**Answer: A**

**Solution:**

Malt contain enzyme that converts starch into maltose specifically the enzyme diastase is responsible for breaking down starch into maltose

## Question26

In the extraction of iron using blast furnace to remove the impurity ( $X$ ), chemical ( $Y$ ) is added to the ore.  $X$  and  $Y$  are respectively

Options:

A.

$\text{SiO}_2, \text{MgCO}_3$

B.

$\text{FeO}, \text{SiO}_2$

C.

$\text{SiO}_2, \text{CaCO}_3$

D.

$\text{SiO}_2, \text{FeCO}_3$

**Answer: C**

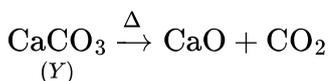

**Solution:**

Iron is made from its ore in a blast furnace. The iron ore has an impurity called  $X$ .

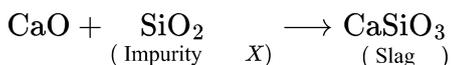

To remove  $X$ , another chemical,  $Y$ , is added to the mixture.

The chemical  $Y$  is calcium carbonate ( $\text{CaCO}_3$ ).

When  $Y$  is heated ( $\Delta$ ), it breaks down into calcium oxide ( $\text{CaO}$ ) and carbon dioxide ( $\text{CO}_2$ ):

Next, calcium oxide ( $\text{CaO}$ ) reacts with the impurity, silicon dioxide ( $\text{SiO}_2$ ), which is  $X$ , to form a liquid waste called slag:

So,  $X$  is silicon dioxide ( $\text{SiO}_2$ ), and  $Y$  is calcium carbonate ( $\text{CaCO}_3$ ).

---

## Which one of the following statements is not correct?

### Options:

A.

Chlorine oxidises ferrous salts to ferric salts in acidic medium.

B.

Chlorine oxidises iodine to periodic acid in water.

C.

Chlorine acts as a bleaching agent due to oxidation.

D.

Chlorine is manufactured by Deacon's process.

**Answer: B**

### Solution:

#### Option A: Chlorine oxidises ferrous salts to ferric salts in acidic medium.

- Ferrous ( $\text{Fe}^{2+}$ ) has an oxidation state of +2. Ferric ( $\text{Fe}^{3+}$ ) has an oxidation state of +3.
- Chlorine ( $\text{Cl}_2$ ) is a strong oxidizing agent.
- In acidic medium, chlorine readily oxidizes  $\text{Fe}^{2+}$  to  $\text{Fe}^{3+}$ :

- This statement is **correct**.

#### Option B: Chlorine oxidises iodine to periodic acid in water.

- Iodine ( $\text{I}_2$ ) has an oxidation state of 0.
- Periodic acid ( $\text{HIO}_4$ ) has iodine in a +7 oxidation state.
- When chlorine reacts with iodine in the presence of water, it typically oxidizes iodine to iodic acid ( $\text{HIO}_3$ ), where iodine is in a +5 oxidation state:

- To obtain periodic acid ( $\text{HIO}_4$ ), a much stronger oxidizing agent than chlorine (like hot concentrated nitric acid, or by electrolysis, or certain peroxo compounds) is generally required, or specific conditions like strongly alkaline medium with hypochlorite. Simple "chlorine in water" does not usually produce periodic acid from iodine.
- Therefore, this statement is **incorrect**.

#### Option C: Chlorine acts as a bleaching agent due to oxidation.

- When chlorine dissolves in water, it forms hypochlorous acid (HOCl):

- Hypochlorous acid is a powerful oxidizing agent. It decomposes to release nascent oxygen ([O]), which oxidizes colored substances into colorless ones, thereby achieving bleaching.

- Thus, the bleaching action of chlorine is indeed due to oxidation.
- This statement is **correct**.

**Option D: Chlorine is manufactured by Deacon's process.**

- Deacon's process is an industrial method for the production of chlorine. It involves the catalytic oxidation of hydrogen chloride gas with atmospheric oxygen, usually using copper(II) chloride as a catalyst at high temperatures:

- While electrolysis of brine is the predominant modern method, Deacon's process is a known and historically significant method for chlorine manufacturing.
- This statement is **correct**.

Based on the analysis, Option B is the incorrect statement.

The final answer is **B**

## Question 29

Consider the following.

**Assertion (A)** Phosphorus can form both phosphorus (III) and phosphorus (V) chlorides but nitrogen cannot form nitrogen (V) chloride.

**Reason (R)** The electronegativity of nitrogen is more than that of phosphorus.

The correct answer is

**Options:**

A.

Both (A) and (R) are correct, (R) is the correct explanation of (A).

B.

(A) is correct, but (R) is not correct.

C.

Both (A) and (R) are correct, (R) is not the correct explanation of (A).

D.

(A) is not correct, but (R) is correct.

**Answer: C**

### **Solution:**

Both the Assertion and the Reason are correct statements, but the Reason does not explain the Assertion properly.

Phosphorus can make both phosphorus(III) chloride and phosphorus(V) chloride because phosphorus has empty *d*-orbitals in its outer shell. This lets phosphorus use these orbitals to form more than four bonds, so it can form compounds like PCl<sub>5</sub> (phosphorus(V) chloride).

Nitrogen cannot form nitrogen(V) chloride (NCl<sub>5</sub>) because nitrogen does not have *d*-orbitals in its valence shell. It can only make up to four bonds, so it cannot expand its octet to form five bonds like phosphorus can.

Therefore, the main reason why phosphorus can form PCl<sub>5</sub> but nitrogen cannot form NCl<sub>5</sub> is the availability of *d*-orbitals in phosphorus, not the difference in electronegativity.

---

## **Question30**

$E_{M^3|M^{2+}}^{\circ}$  ( in V ) is highest for

**Options:**

A.

Fe

B.

Mn

C.

Cr

D.

V

**Answer: B**

**Solution:**

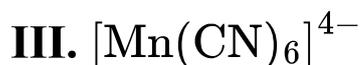

$E_{M^{3+}/M^{2+}}^\circ$  is highest for Mn i.e., = +1.57 V

It is due to stability of  $Mn^{2+}$  ion which has a half filled  $d$ -orbitals.

---

## Question31

Arrange the following complexes in the increasing order of their spin only magnetic moment (in B.M)

**Options:**

A.

B.

C.

D.

**Answer: D**

**Solution:**

The magnetic moment of a complex depends on the number of unpaired electrons present in it.

**Formula:** The spin-only magnetic moment is given by  $\mu = \sqrt{n(n+2)}$  where  $n$  is the number of unpaired electrons.

**Counting Unpaired Electrons for Each Complex:**

I.  $[\text{Fe}(\text{CN})_6]^{4-}$ : Here,  $n = 0$ . This means there are no unpaired electrons.

II.  $[\text{MnCl}_4]^{2-}$ : Here,  $n = 5$ . There are five unpaired electrons.

III.  $[\text{Mn}(\text{CN})_6]^{4-}$ : Here,  $n = 1$ . There is one unpaired electron.

IV.  $[\text{Cr}(\text{NH}_3)_6]^{3+}$ : Here,  $n = 3$ . There are three unpaired electrons.

The complexes with more unpaired electrons will have higher magnetic moments.

**So, the order from least to greatest magnetic moment is:**

I < III < IV < II

---

## Question32

**Neoprene is the polymer of a monomer X. IUPAC name of X is**

**Options:**

A.

1, 3-butadiene

B.

2-methyl-1, 3-butadiene

C.

2-iodo-1, 3-butadiene

D.

2-chloro-1,3-butadiene

**Answer: D**

**Solution:**

The monomer of neoprene is chloroprene. It's IUPAC name is, 2-chloro-1,3-butadiene.

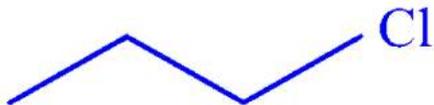

---

## Question33

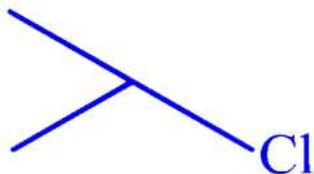

On prolonged heating with HI, glucose gives a compound 'C' which can be obtained by Wurtz reaction using sodium metal and compound 'D'. Identify 'D'.

Options:

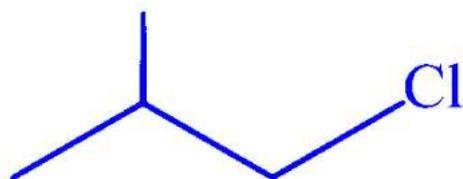

A.

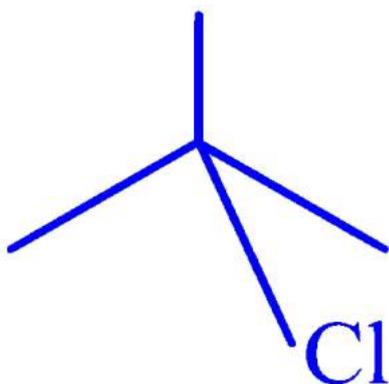

B.

C.

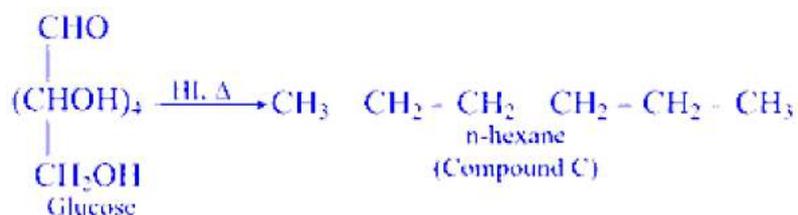

D.

**Answer: A**

**Solution:**

Thus, compound 'D' is 

## Question34

Match the following

List-I (Chemical)		List-II (Type)	
A	Bithionol	I	Artificial sweetener
B	Saccharin	II	Antifertility drug
C	Sodium benzoate	III	Antiseptic
D	Norethindrone	IV	Food preservative

**The correct answer is**

**Options:**

A.

A-III, B-I, C-IV, D-II

B.

A-II, B-I, C-IV, D-III

C.

A-III, B-II, C-IV, D-I

D.

A-IV, B-I, C-II, D-III

**Answer: A**

## Solution:

- **A. Bithionol:** Bithionol is an antiseptic. It is commonly added to soaps to reduce its antiseptic properties.
  - Therefore, A matches with **III (Antiseptic)**.
- **B. Saccharin:** Saccharin is one of the oldest and most widely used artificial sweeteners.
  - Therefore, B matches with **I (Artificial sweetener)**.
- **C. Sodium benzoate:** Sodium benzoate is a common food preservative, particularly in acidic foods.
  - Therefore, C matches with **IV (Food preservative)**.
- **D. Norethindrone:** Norethindrone is a synthetic progestin that is used as a contraceptive (birth control pill). It is an antifertility drug.
  - Therefore, D matches with **II (Antifertility drug)**.

Combining these matches, we get:

A - III

B - I

C - IV

D - II

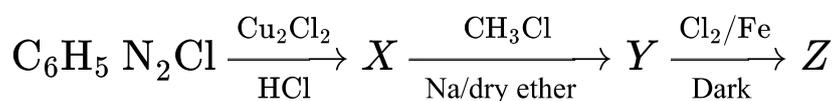

This combination matches **Option A**.

The final answer is A

---

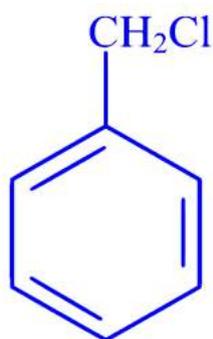

## Question35

What is the product ' Z ' in the following reaction sequence?

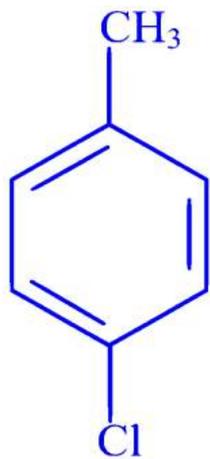

Options:

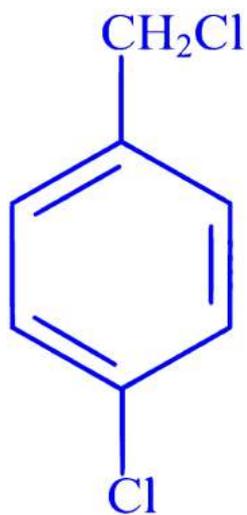

A.

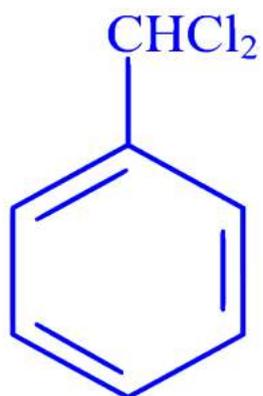

B.

C.

D.

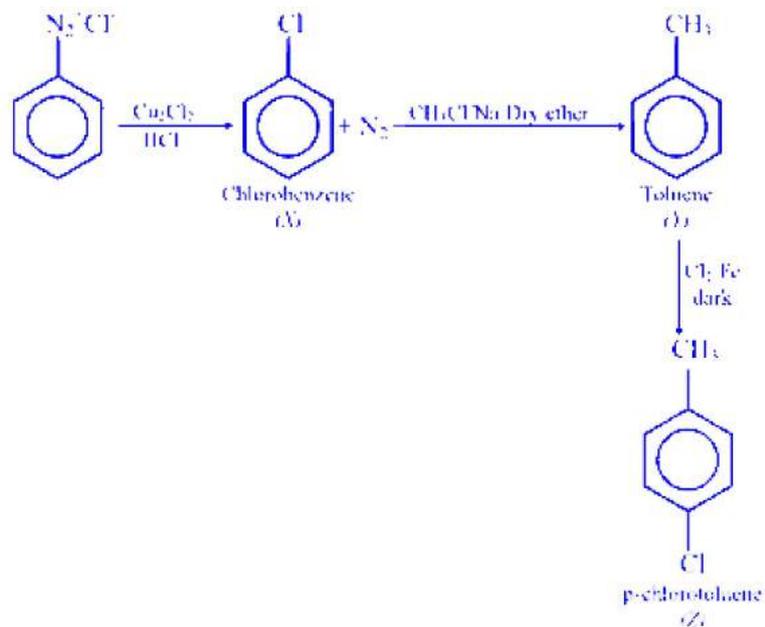

**Answer: B**

**Solution:**

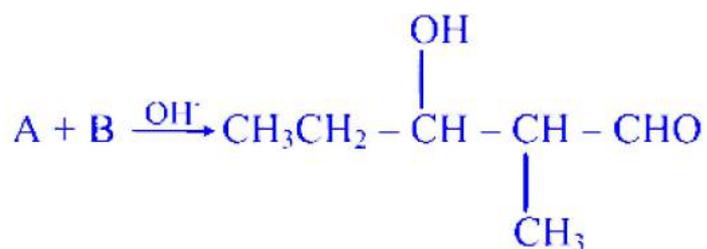

The complete reaction sequence is

### Question36

Identify the compounds *A* and *B* involved in the formation of given aldol

Options:

A.

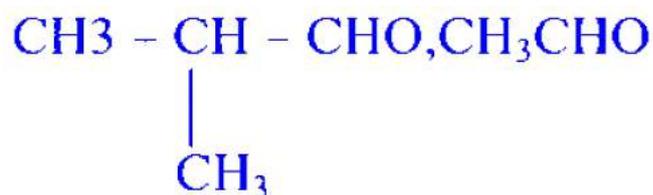

B.

C.

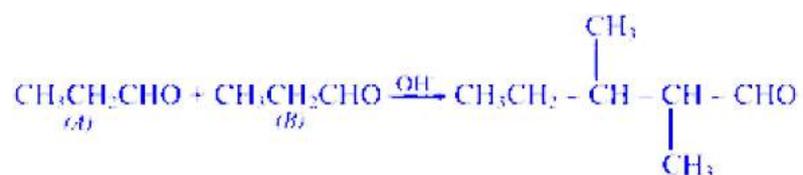

D.

Answer: C

## Solution:

The complete reaction sequence is as follows,

---

## Question37

In which of the following, intramolecular hydrogen bonding is present?

Options:

A.

Resorcinol

B.

Catechol

C.

Quinol

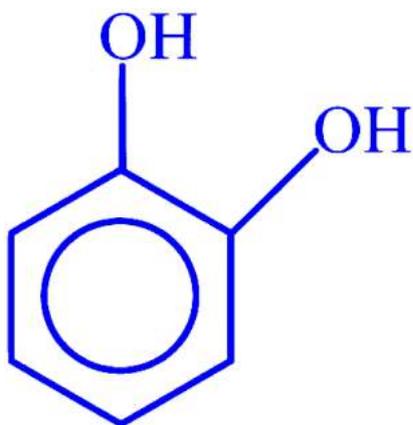

D.

o-cresol

**Answer: B**

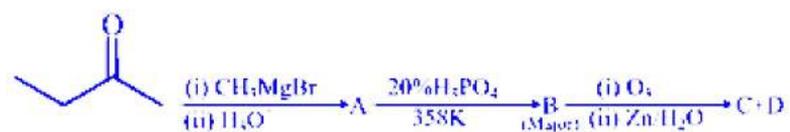

**Solution:**

Among the given options, intramolecular hydrogen bonding is present in catechol.

### Question38

The products *C* and *D* are

**Options:**

A.

Ethanoic acid, ethanal

B.

Ethanol, propanone

C.

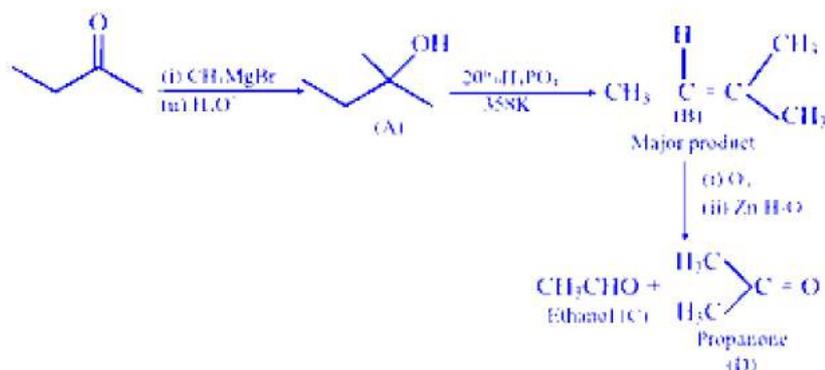

Ethanal, propanone

D.

Propanal, propanone

**Answer: C**

## Solution:

## Question 39

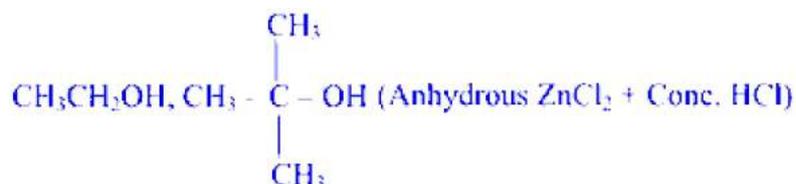

Identify the incorrect match with respect to compounds to be distinguished and reagent used

Options:

A.

CH<sub>3</sub>OH, CH<sub>3</sub>CH<sub>2</sub>OH ··· - I<sub>2</sub> + NaOH solution)

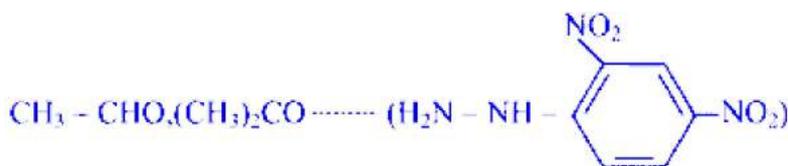

B.

C.

CH<sub>3</sub>-C≡CH, CH<sub>3</sub>-C≡C-CH<sub>3</sub> ··· - (Na)

D.

**Answer: D**

**Solution:**

Incorrect match with respect to compounds to be distinguished and reagent used is given in option (d). It is because 2,4-dinitrophenylhydrazine confirms the presence of carbonyl group (C=O) which is present in

both aldehydes and ketones. Thus, this reagent cannot be used to distinguish given compounds.

---

## Question40

**The reagent which is used to distinguish primary, secondary and tertiary amines from the mixture is**

**Options:**

A.

Fehling's reagent

B.

Tollen's reagent

C.

Lucas reagent

D.

Hinsberg's reagent

**Answer: D**

**Solution:**

Hinsberg's reagent is used to distinguish between primary, secondary and tertiary amines from a mixture.

---

## Physics

## Question1

**The phenomenon of physics that deals with the constitution and structure of matter at the minute scales of atoms and nuclei is**

**Options:**

A.

microscopic domain

B.

macroscopic domain

C.

classical physics

D.

thermodynamics

**Answer: A**

**Solution:**

Microscopic domain of physics is the phenomenon that deals with the constitution and structure of matter at the minute scales of atoms and nuclei.

---

## Question2

**If the length of a rod is measured as 830600 mm , then the number of significant figures in the measurement is**

**Options:**

A.

5

B.

3

C.

6

D.

4

**Answer: D**

**Solution:**

The measured length is 830600 mm.

Because there is no decimal point in this number, the zeros at the end (the last two zeros) are not counted as significant figures.

So, only the digits 8, 3, 0, and 6 are significant.

Therefore, the number of significant figures in 830600 mm is 4.

---

## Question3

**A particle initially at rest is moving along a straight line with an acceleration of  $2 \text{ ms}^{-2}$ . At a time of 3 s after the beginning of motion, the direction of acceleration is reversed. The time from the beginning of the motion in which the particle returns to its initial position is**

**Options:**

A.

$$(3 + \sqrt{3})\text{s}$$

B.

$$(2 + \sqrt{2})\text{s}$$

C.

$$3(2 + \sqrt{2})\text{s}$$

D.

$$2(3 + \sqrt{3})\text{s}$$

**Answer: C**

**Solution:**

Distance covered by the particle in first 3 seconds.

$$\begin{aligned} s &= ut + \frac{1}{2}at^2 \\ &= 0 \times 3 + \frac{1}{2} \times 2 \times 3^2 \\ &= 9 \text{ m} \end{aligned}$$

Velocity of particle after 3 s .

$$v = u + at = 0 + 2 \times 3 = 6 \text{ m/s}$$

After  $t = 3$  s, direction of acceleration is reversed, so new acceleration,

$$a' = -2 \text{ m/s}^2$$

Since, particle returns to its initial position, thus,

$$s_1 + s_2 = 0$$

$$s_2 = -s_1 = -s = -9 \text{ m}$$

$$\therefore s_2 = vt' + \frac{1}{2}a'(t')^2$$

$$-9 = 6t' + \frac{1}{2} \times (-2)(t')^2$$

$$\Rightarrow (t')^2 - 6t' - 9 = 0$$

$$\Rightarrow t' = \frac{-(-6) \pm \sqrt{36 + 36}}{2 \times 1}$$

$$= 3 \pm 3\sqrt{2}$$

$$\Rightarrow t' = (3 + 3\sqrt{2})\text{s}$$

The total time from the beginning of the motion until the particle returns to its initial position,

$$T = 3 + t'$$

$$= 3 + 3 + 3\sqrt{2} = 6 + 3\sqrt{2}$$

$$= 3(2 + \sqrt{2})\text{s}$$

---

## Question4

**If a body projected with a velocity of  $19.6 \text{ ms}^{-1}$  reaches a maximum height of  $9.8 \text{ m}$  , then the range of the projectile is**

**(Neglect air resistance)**

**Options:**

A.

19.6 m

B.

78.4 m

C.

39.2 m

D.

9.8 m

**Answer: B**

## **Solution:**

### **Step 1: Write the formula for maximum height**

The formula for the highest point a projectile can reach is:

$$H = \frac{u^2 \sin^2 \theta}{2g}$$

where  $H$  is maximum height,  $u$  is the starting speed,  $\theta$  is the angle of projection, and  $g$  is gravity.

### **Step 2: Put in the given values**

We know  $H = 9.8$  m,  $u = 19.6$  ms<sup>-1</sup>, and  $g = 9.8$  ms<sup>-2</sup>. We put these in the formula:

$$9.8 = (19.6)^2 \frac{\sin^2 \theta}{2 \times 9.8}$$

### **Step 3: Simplify to find $\sin^2 \theta$**

Multiply both sides by  $2 \times 9.8$ :

$$9.8 = 19.6 \times 19.6 \times \frac{\sin^2 \theta}{2 \times 9.8}$$

$$\Rightarrow 9.8 = 39.2 \sin^2 \theta$$

Divide both sides by 19.6,

$$\sin^2 \theta = \frac{1}{2}$$

### **Step 4: Find the angle $\theta$**

$$\sin \theta = \frac{1}{\sqrt{2}} = \sin 45^\circ, \text{ so}$$

$$\theta = 45^\circ.$$

### **Step 5: Write the formula for range $R$**

The formula for how far the projectile lands (range) is:

$$R = \frac{u^2 \sin 2\theta}{g}$$

### **Step 6: Put in the numbers**

Since  $u = 19.6$  ms<sup>-1</sup>,  $\theta = 45^\circ$ , and  $g = 9.8$  ms<sup>-2</sup>,

$$R = \frac{(19.6)^2 \times \sin(2 \times 45^\circ)}{9.8}$$

$\sin(90^\circ) = 1$ , so

$$R = \frac{(19.6)^2 \times 1}{9.8}$$

$$R = \frac{384.16}{9.8} = 39.2 \text{ m}$$

---

## Question 5

A force separately produces accelerations of  $18 \text{ ms}^{-2}$ ,  $9 \text{ ms}^{-2}$  and  $6 \text{ ms}^{-2}$  in three bodies of masses  $P$ ,  $Q$  and  $R$  respectively. If the same force is applied on a body of mass  $P + Q + R$ , then the acceleration of that body is

Options:

A.

$$3 \text{ ms}^{-2}$$

B.

$$6 \text{ ms}^{-2}$$

C.

$$2 \text{ ms}^{-2}$$

D.

$$33 \text{ ms}^{-2}$$

**Answer: A**

**Solution:**

Let  $m_P$ ,  $m_Q$ , and  $m_R$  be the masses of the bodies  $P$ ,  $Q$ , and  $R$ .

**Step 1: Write the formula for mass using force and acceleration.**

We know that  $F = m \times a$ . Rearranging,  $m = \frac{F}{a}$ .

**Step 2: Find the mass of each body.**

$$\text{For } P, m_P = \frac{F}{18}$$

$$\text{For } Q, m_Q = \frac{F}{9}$$

$$\text{For } R, m_R = \frac{F}{6}$$

**Step 3: Add all the masses to get total mass.**

$$m_{PQR} = m_P + m_Q + m_R$$

$$\text{So, } m_{PQR} = \frac{F}{18} + \frac{F}{9} + \frac{F}{6}$$

$$\text{Find a common denominator: } m_{PQR} = \frac{F}{18} + \frac{2F}{18} + \frac{3F}{18} = \frac{6F}{18} = \frac{F}{3}$$

**Step 4: Find the acceleration of the combined mass with the same force.**

$$\text{Acceleration, } a_{PQR} = \frac{F}{m_{PQR}} = \frac{F}{(F/3)}$$

The  $F$  cancels out:  $a_{PQR} = 3 \text{ m/s}^2$

---

## Question6

**A body of mass 500 g is falling from rest from a height of 3.2 m from the ground. If the body reaches the ground with a velocity of  $6 \text{ ms}^{-1}$ , then the energy lost by the body due to air resistance is (Acceleration due to gravity =  $10 \text{ ms}^{-2}$  )**

**Options:**

A.

14 J

B.

7 J

C.

21 J

D.

28 J

**Answer: B**

**Solution:**

Initial energy of body

$$E_i = mgh = 0.5 \times 10 \times 3.2 = 16 \text{ J}$$

Final energy of the body

$$E_f = \frac{1}{2}mv^2 = \frac{1}{2} \times 0.5 \times 6^2 = 9 \text{ J}$$

$\therefore$  Loss of energy due to air resistance

$$\Delta U = U_i - U_f = 16 - 9 = 7 \text{ J}$$

---

## Question 7

A body of mass ' $m$ ' moving with a velocity of ' $v$ ' collides head on with another body of mass ' $2m$ ' at rest. If the coefficient of restitution between the two bodies is ' $e$ ', then the ratio of the velocities of the two bodies after collision is

Options:

A.

$$\frac{1+e}{1-2e}$$

B.

$$\frac{1+2e}{1-e}$$

C.

$$\frac{1-e}{1+2e}$$

D.

$$\frac{1-2e}{1+e}$$

**Answer: D**

**Solution:**

According to conservation of linear momentum

$$\begin{aligned} \Rightarrow mv + 2m \times 0 &= mv_1 + 2mv_2 \\ \Rightarrow v &= v_1 + 2v_2 \quad \dots (i) \end{aligned}$$

Coefficient of restitution

$$\begin{aligned} e &= \frac{v_2 - v_1}{u_1 - u_2} \\ \Rightarrow e &= \frac{v_2 - v_1}{v - 0} \\ \Rightarrow ev &= v_2 - v_1 \\ \Rightarrow v_1 &= v_2 - ev \quad \dots (ii) \end{aligned}$$

From Eqs. (i) and (ii), we get

$$\begin{aligned} v &= v_2 - ev + 2v_2 \\ v &= 3v_2 - ev \\ \Rightarrow v(1+e) &= 3v_2 \\ \Rightarrow v_2 &= \frac{v(1+e)}{3} \quad \dots (iii) \end{aligned}$$

Now, from Eq. (ii) and (iii), we get,

$$v_1 = \frac{v(1+e)}{3} - ev = \frac{v(1-2e)}{3}$$

$$\Rightarrow v_1 = \frac{v(1-2e)}{3}$$

$$\text{Thus, } \frac{v_1}{v_2} = \frac{1-2e}{1+e}$$

---

## Question8

**A thin uniform circular disc of mass  $\frac{10}{\pi^2}$  kg and radius 2 m is rotating about an axis passing through its centre and perpendicular to its plane. The work done to increase the angular speed of the disc from 90rev/min to 120rev/min is**

**Options:**

A.

35 J

B.

70 J

C.

140 J

D.

210 J

**Answer: B**

**Solution:**

**Step 1: Find the moment of inertia of the disc.**

The moment of inertia ( $I$ ) for a disc about its center is  $I = \frac{1}{2}MR^2$

Here, the mass  $M = \frac{10}{\pi^2}$  kg, and the radius  $R = 2$  m.

$$\text{So, } I = \frac{1}{2} \times \frac{10}{\pi^2} \times (2)^2 = \frac{1}{2} \times \frac{10}{\pi^2} \times 4 = \frac{20}{\pi^2} \text{ kg m}^2$$

**Step 2: Change revolutions per minute (rev/min) to angular speed (rad/s).**

The first speed is 90 rev/min. To convert to radians per second:

$$w_1 = 90 \times \frac{2\pi}{60} = 3\pi \text{ rad/s}$$

The second speed is 120 rev/min:  $w_2 = 120 \times \frac{2\pi}{60} = 4\pi \text{ rad/s}$

**Step 3: Use the rotational kinetic energy formula to find work done.**

The work done to increase speed equals the change in rotational kinetic energy:

$$\text{Work Done} = \Delta KE = \frac{1}{2}I(w_2^2 - w_1^2)$$

$$\text{Plug in the values: Work} = \frac{1}{2} \times \frac{20}{\pi^2} [(4\pi)^2 - (3\pi)^2]$$

Calculate:

$$(4\pi)^2 = 16\pi^2$$

$$(3\pi)^2 = 9\pi^2$$

$$\text{So, } 16\pi^2 - 9\pi^2 = 7\pi^2$$

$$\text{Therefore, Work} = \frac{1}{2} \times \frac{20}{\pi^2} \times 7\pi^2 = 10 \times 7 = 70 \text{ J}$$

---

## Question9

**A solid cylinder of mass 2 kg , length 40 cm and radius 10 cm is placed in contact with a solid sphere of mass 0.5 kg and radius 10 cm such that the centres of the two bodies lie along the geometrical axis of the cylinder. The distance of the centre of mass of the system of two bodies from the centre of the sphere is**

**Options:**

A.

27 cm

B.

15 cm

C.

24 cm

D.

18 cm

**Answer: C**

**Solution:**

Let the centre of the sphere be at origin (  $x = 0$  ).

Then, the centre of the cylinder lies at a distance of  $x = 0.3$  m from the sphere centre.

CM of the system

$$X_{\text{CM}} = \frac{m_1x_1 + m_2x_2}{m_1 + m_2}$$
$$= \frac{2 \times 0.3 + 0.5 \times 0}{2 + 0.5}$$

$$X_{\text{CM}} = \frac{0.6}{2.5} = 0.24 \text{ m}$$

or  $X_{\text{CM}} = 24$  cm (From the centre of sphere)

---

## Question10

**If the amplitude of a damped harmonic oscillator becomes half of its initial amplitude in a time of 10 s , then the time taken for the mechanical energy of the oscillator to become half of its initial mechanical energy is**

**Options:**

A.

2.5 s

B.

20 s

C.

10 s

D.

5 s

**Answer: D**

**Solution:**

### Understanding the Amplitude Change:

The formula for how the amplitude ( $A$ ) of a damped oscillator changes over time is:  $A(t) = A_0 e^{-bt/2m}$  where  $A_0$  is the starting amplitude,  $b$  is the damping constant,  $m$  is the mass, and  $t$  is time.

We are told the amplitude drops to half its original value in 10 seconds. So,  $A(t) = \frac{A_0}{2}$  when  $t = 10$  s.

### Setting Up the Equation:

We set  $\frac{A_0}{2} = A_0 e^{-10b/2m}$

Divide both sides by  $A_0$  to get:  $\frac{1}{2} = e^{-10b/2m}$

Take the natural logarithm of both sides:  $\ln(2) = \frac{10b}{2m}$

So,  $\frac{b}{m} = \frac{\ln(2)}{5}$

### Now, How Long for Energy to Halve?

Mechanical energy  $E$  is proportional to the square of amplitude:  $E \propto A^2$ . It also decays exponentially, but at twice the rate:  $E(t) = E_0 e^{-bt/m}$

We're looking for time when  $E(t) = \frac{E_0}{2}$

So,  $\frac{E_0}{2} = E_0 e^{-bt/m}$

Divide by  $E_0$ :  $\frac{1}{2} = e^{-bt/m}$

Take the natural log:  $\ln(2) = \frac{bt}{m}$

### Plug in the Value of $\frac{b}{m}$ :

From before,  $\frac{b}{m} = \frac{\ln(2)}{5}$ , so substitute this into the energy equation:

$$\ln(2) = \left[ \frac{\ln(2)}{5} \right] t$$

Divide both sides by  $\frac{\ln(2)}{5}$ :  $t = 5$  seconds

**Final Answer:** It takes 5 seconds for the mechanical energy to become half of its original value.

-----

## Question 11

**A body is projected from the Earth's surface with a speed  $\sqrt{5}$  times the escape speed ( $V_e$ ). The speed of the body when it escapes from the gravitational influence of the Earth is**

**Options:**

A.

2  $V_e$

B.

$V_e$

C.

3  $V_e$

D.

5  $V_e$

**Answer: A**

## Solution:

### Step 1: Use the conservation of energy

When an object moves in Earth's gravity, its total energy (kinetic plus potential) stays the same if no energy is lost.

### Step 2: Write the energy equation

The equation is:  $\frac{1}{2}mV_i^2 - \frac{GMm}{R} = \frac{1}{2}mV_f^2 + 0$

Here,  $V_i$  is the speed at the start, and  $V_f$  is the speed far away from Earth (where gravity is almost zero).

### Step 3: Substitute the initial speed

The body is thrown with speed  $V_i = \sqrt{5}V_e$ , where  $V_e$  is escape velocity.

### Step 4: Plug in values and simplify

$$\frac{1}{2}m(\sqrt{5}V_e)^2 - \frac{gR^2m}{R} = \frac{1}{2}mV_f^2$$

$$\Rightarrow \frac{5}{2}mV_e^2 - gRm = \frac{1}{2}mV_f^2$$

$$\Rightarrow \frac{5}{2}V_e^2 - gR = \frac{1}{2}V_f^2$$

### Step 5: Express $gR$ in terms of $V_e$

Remember,  $V_e = \sqrt{2gR}$ . Square both sides to get  $V_e^2 = 2gR$ .

$$\text{So, } gR = \frac{V_e^2}{2}.$$

### Step 6: Substitute and solve for $V_f$

Plug  $gR = \frac{V_e^2}{2}$  into the previous equation:

$$\frac{5}{2}V_e^2 - \frac{V_e^2}{2} = \frac{1}{2}V_f^2$$

$$(5 - 1)\frac{V_e^2}{2} = \frac{1}{2}V_f^2$$

$$4\frac{V_e^2}{2} = \frac{1}{2}V_f^2$$

Multiply both sides by 2:

$$4V_e^2 = V_f^2$$

Take square root:

$$V_f = 2V_e$$

---

## Question12

**A metal rod of area of cross-section  $3 \text{ cm}^2$  is stretched along its length by applying a force of  $9 \times 10^4 \text{ N}$ . If the Young's modulus of the material of the rod is  $2 \times 10^{11} \text{ Nm}^{-2}$ , the energy stored per unit volume in the stretched rod is**

**Options:**

A.

$$13.5 \times 10^5 \text{ Jm}^{-3}$$

B.

$$9 \times 10^5 \text{ Jm}^{-3}$$

C.

$$225 \times 10^5 \text{ Jm}^{-3}$$

D.

$$4.5 \times 10^5 \text{ Jm}^{-3}$$

**Answer: C**

**Solution:**

The energy stored per unit volume in a stretched rod

$$\begin{aligned}
u &= \frac{1}{2} \times \text{stress} \times \text{strain} \\
&= \frac{1}{2} \times \text{stress} \times \frac{\text{stress}}{Y} \\
&= \frac{1}{2} \times \frac{(\text{stress})^2}{Y} = \frac{1}{2} \times \frac{\left(\frac{F}{A}\right)^2}{Y} \\
&= \frac{1}{2} \times \frac{\left(\frac{9 \times 10^4}{3 \times 10^{-4}}\right)^2}{2 \times 10^{11}} = \frac{1}{2} \times \frac{9 \times 10^{16}}{2 \times 10^{11}} \\
&= 2.25 \times 10^5 \text{ Jm}^{-3}
\end{aligned}$$

---

## Question13

An air bubble rises from the bottom to the top of a water tank in which the temperature of the water is uniform. The surface area of the bubble at the top of the tank is 125% more than its surface area at the bottom of the tank. If the atmospheric pressure is equal to the pressure of 10 m water column, then the depth of water in the tank is

Options:

A.

16.25 m

B.

27 m

C.

19 m

D.

23.75 m

**Answer: D**

**Solution:**

**Step 1: Find Surface Area Relationship**

The bubble's surface area at the top is 125% more than at the bottom. This means:

$$A_{\text{top}} = A_{\text{bottom}} + 1.25A_{\text{bottom}} = 2.25A_{\text{bottom}}$$

**Step 2: Connect Surface Area and Volume**

The volume ( $V$ ) of a bubble is related to its surface area ( $A$ ) by:  $V \propto A^{3/2}$

**Step 3: Express Volume Change**

Let  $V_1$  be the volume at the bottom, and  $V_2$  at the top. Then,

$$\frac{V_2}{V_1} = \left(\frac{A_2}{A_1}\right)^{3/2} = (2.25)^{3/2} = 3.375$$

**Step 4: Use Boyle's Law for Pressure and Volume**

Since the water temperature is the same, Boyle's law applies:  $p_1 V_1 = p_2 V_2$   $\frac{p_1}{p_2} = \frac{V_2}{V_1} = 3.375$

**Step 5: Write Out Pressure at Bottom and Top**

At the bottom, pressure is  $p_1 =$  atmospheric pressure + pressure from water column with height  $h$  Atmospheric pressure is equal to water pressure from 10 m column. So:  $p_1 = 10 + h$  At the top, the pressure is just the atmospheric pressure:  $p_2 = 10$

**Step 6: Set Up the Equation and Solve for  $h$**

So,  $\frac{p_1}{p_2} = \frac{10+h}{10}$  Set equal to 3.375:  $\frac{10+h}{10} = 3.375$   $10 + h = 33.75$   $h = 23.75$  m

---

## Question14

If  $W_1$  is the work done in increasing the radius of a soap bubble from '  $r$  ' to '  $2r$  ' and  $W_2$  is the work done in increasing the radius of the soap bubble from '  $2r$  ' to '  $3r$  ', then  $W_1 : W_2 =$

**Options:**

A.

3 : 5

B.

1 : 1

C.

2 : 3

D.

3 : 4

**Answer: A**

**Solution:**

To find the work done to make a soap bubble bigger, we use the formula:

$$W = 2T \cdot \Delta A$$

**Step 1: Find Change in Surface Area for  $W_1$**

The surface area of a sphere is  $4\pi r^2$ . When the radius goes from  $r$  to  $2r$ , the change in area is:

$$\Delta A = 4\pi(2r)^2 - 4\pi r^2$$

This simplifies to:

$$= 16\pi r^2 - 4\pi r^2 = 12\pi r^2$$

**Step 2: Find Work Done  $W_1$**

Plug the change in area into the work formula:

$$W_1 = 2T \cdot 12\pi r^2 = 24\pi T r^2$$

**Step 3: Find Change in Surface Area for  $W_2$**

Now, change the radius from  $2r$  to  $3r$ :

$$\Delta A = 4\pi(3r)^2 - 4\pi(2r)^2$$

$$= 36\pi r^2 - 16\pi r^2 = 20\pi r^2$$

**Step 4: Find Work Done  $W_2$**

Plug in this change in area:

$$W_2 = 2T \cdot 20\pi r^2 = 40\pi T r^2$$

**Step 5: Ratio  $W_1 : W_2$**

$$W_1 : W_2 = 24 : 40 = 3 : 5$$

---

## Question15

**To increase the length of a metal rod by 0.4% the temperature of the rod is to be increased by (Coefficient of linear expansion of the metal  $= 20 \times 10^{-6} \text{ } ^\circ\text{C}^{-1}$ )**

**Options:**

A.

373 K

B.

473 K

C.

200 K

D.

100 K

**Answer: C**

**Solution:**

We know that

$$\begin{aligned}\Delta L &= L \alpha \Delta T \\ \Rightarrow \Delta T &= \frac{\Delta L}{\Delta \alpha} = \left( \frac{\Delta L}{L} \right) \frac{1}{\alpha} \\ &= 0.004 \times \frac{1}{20 \times 10^{-6}} \\ &= 0.002 \times 10^5 = 200 \text{ K}\end{aligned}$$

---

## Question16

**The power of a refrigerator that can make 15 kg of ice at 0°C from water at 30°C in one hour is**

**Options:**

A.

6600 W

B.

1925 W

C.

2200 W

D.

4620 W

**Answer: B**

**Solution:**

Heat released from water to bring it at  $0^\circ\text{C}$ ,

$$Q_1 = mc_W \Delta T = 15 \times 4200 \times 30 \\ = 1.89 \times 10^6 \text{ J}$$

Heat released to convert water at  $0^\circ\text{C}$  to ice at  $0^\circ\text{C}$ ,

$$Q_2 = mL_f = 15 \times 3.34 \times 10^5 \\ = 5.01 \times 10^6 \text{ J}$$

Total heat released

$$Q = Q_1 + Q_2 \\ = 1.89 \times 10^6 + 5.01 \times 10^6 \\ = 6.9 \times 10^6 \text{ J}$$

$\therefore$  Power of refrigerator,  $P = \frac{Q}{t}$

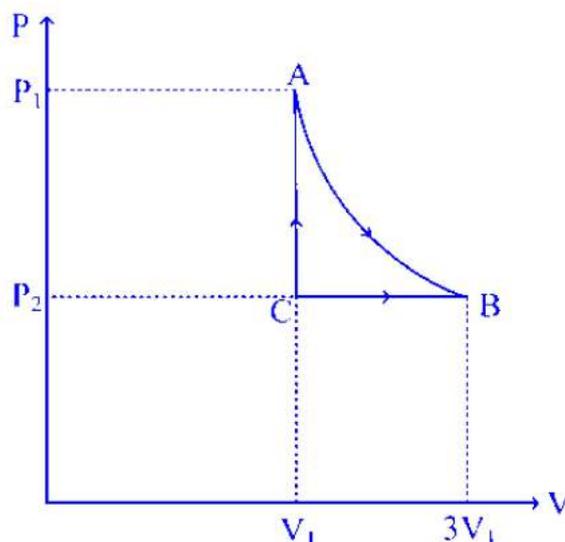

$$= \frac{6.9 \times 10^6}{1 \times 60 \times 60} \\ = 1916.67 \text{ W}$$

Which is nearest to 1925 W

---

## Question17

Three moles of an ideal gas undergoes a cyclic process  $ABCA$  as shown in the figure. The pressure, volume and absolute temperature at points  $A$ ,  $B$  and  $C$  are respectively  $(p_1, V_1, T_1)$ ,  $(p_2, 3V_1, T_1)$  and  $(p_2, V_1, T_2)$ . Then, the total work done in the cycle  $ABCA$  is ( $R =$  Universal gas constant).

**Options:**

A.

$$RT_1[3 \ln(3) + 2]$$

B.

$$RT_1[3 \ln(2)]$$

C.

$$3RT_1[\ln(3)]$$

D.

$$RT_1[3 \ln(3) - 2]$$

**Answer: D****Solution:**

Given, process  $AB$  is isothermal Work done by the gas in isothermal process  $AB$  is,

$$\begin{aligned} &= W_{AB} = nRT_1 \ln \left( \frac{V_2}{V_1} \right) \\ &= nRT_1 \ln \left( \frac{3V_1}{V_1} \right) \\ &= nRT_1 \ln 3 \\ &= 3RT_1 \ln(3) \end{aligned}$$

Compression work of process  $BC$  on the gas is

$$\begin{aligned} W_{BC} &= p\Delta V = p_2 (V_1 - 3V_1) \\ &= -2p_2 V_1 = -\frac{2}{3} p_2 (3V_1) \\ &= -\frac{2}{3} \cdot 3RT_1 \quad \{ \because p_2 (3V_1) = 3RT_1 \} \\ &= -2RT_1 \end{aligned}$$

Work done in process  $CA = p\Delta V = 0$

Total work done in cyclic process  $ABCA$  is,

$$\begin{aligned}W_{ABCA} &= W_{AB} + W_{BC} + W_{CA} \\ &= 3RT_1 \ln 3 - 2RT_1 \\ &= RT_1(3 \ln 3 - 2)\end{aligned}$$

---

## Question18

The pressure of a mixture of 64 g of oxygen, 28 g of nitrogen and 132 g of carbon dioxide gases in a closed vessel is  $p$ . Under isothermal conditions if entire oxygen is removed from the vessel, the pressure of the mixture of remaining two gases is

Options:

A.

$p$

B.

$\frac{3p}{2}$

C.

$\frac{p}{3}$

D.

$\frac{2p}{3}$

**Answer: D**

**Solution:**

**Step 1: Calculate moles of each gas**

$$n_{\text{O}_2} = \frac{64}{32} = 2 \text{ moles}$$

$$n_{\text{N}_2} = \frac{28}{28} = 1 \text{ mole}$$

$$n_{\text{CO}_2} = \frac{132}{44} = 3 \text{ moles}$$

**Step 2: Add up all the moles for the total initial amount**

$$\begin{aligned} n_i &= n_{\text{O}_2} + n_{\text{N}_2} + n_{\text{CO}_2} \\ &= 2 + 1 + 3 = 6 \text{ moles} \end{aligned}$$

**Step 3: Find out how many moles are left after removing all the oxygen gas**

Only nitrogen ( $\text{N}_2$ ) and carbon dioxide ( $\text{CO}_2$ ) are left.

$$n_f = n_{\text{N}_2} + n_{\text{CO}_2} = 1 + 3 = 4 \text{ moles}$$

**Step 4: Relate pressure and moles using the formula  $pV = nRT$**

Since temperature and volume stay the same, the pressure is directly proportional to the number of moles. So,

$$\frac{p_i}{p_f} = \frac{n_i}{n_f}$$

The starting pressure is  $p$ , so

$$\frac{p}{p_f} = \frac{6}{4}$$

So, the final pressure is  $p_f = \frac{2}{3}p$

---

## Question19

**A sound wave of frequency 210 Hz travels with a speed of  $330 \text{ ms}^{-1}$  along the positive  $X$ -axis. Each particle of the wave moves a distance of 10 cm between the two extreme points. The equation of the displacement function ( s ) of this wave is (  $x$  in metre,  $t$  in second)**

**Options:**

A.

$$s(x, t) = 0.10 \sin[4x - 1320t] \text{m}$$

B.

$$s(x, t) = 0.05 \sin[4x - 1320t] \text{m}$$

C.

$$s(x, t) = 0.05 \sin[1320x - 4t] \text{m}$$

D.

$$s(x, t) = 0.10 \sin[1320x - 4t]m$$

**Answer: B**

## **Solution:**

**Step 1: Find the amplitude.**

The total distance from one extreme point to the other is 10 cm. So the amplitude is half of this: 5 cm = 0.05 m

**Step 2: Find the angular frequency ( $\omega$ ).**

The frequency  $f$  is 210 Hz.

$$\text{Angular frequency: } \omega = 2\pi f = 2 \times \frac{22}{7} \times 210 = 44 \times 30 = 1320 \text{ rad/s.}$$

**Step 3: Find the wave number ( $k$ ).**

The speed  $v$  is 330 m/s.

$$\text{Wave number: } k = \frac{\omega}{v} = \frac{1320}{330} = 4 \text{ rad/m.}$$

**Step 4: Write the equation of the wave.**

The standard equation for a wave traveling along the positive  $X$ -axis is  $s(x, t) = A \sin(kx - \omega t)$ .

Here,  $A = 0.05$  m,  $k = 4$  rad/m, and  $\omega = 1320$  rad/s, so:

$$s(x, t) = 0.05 \sin(4x - 1320t)$$

---

## **Question20**

**A string vibrates in its fundamental mode when a tension  $T_1$  is applied to it. If the length of the string is decreased by 25% and the tension applied is changed to  $T_2$ , the fundamental frequency of the string increases by 100%, then  $\frac{T_2}{T_1} =$**

**(Linear density of the string is constant)**

**Options:**

A.

$$\frac{3}{8}$$

B.

$$\frac{2}{3}$$

C.

$$\frac{8}{9}$$

D.

$$\frac{9}{4}$$

**Answer: D**

## Solution:

### Step 1: Formula for Fundamental Frequency

The basic formula for the frequency of a vibrating string is:

$$f = \frac{1}{2l} \sqrt{\frac{T}{\mu}}$$

Here,  $f$  is frequency,  $l$  is the length of the string,  $T$  is the tension, and  $\mu$  is mass per unit length (which stays the same in this problem).

### Step 2: Frequency with Initial Length and Tension

The first frequency, with length  $l$  and tension  $T_1$  is:

$$f_1 = \frac{1}{2l} \sqrt{\frac{T_1}{\mu}}$$

### Step 3: Frequency After Changing Length and Tension

The length of the string is shortened by 25%, so the new length is 75% of  $l$ , or  $\frac{3}{4}l$ . The new tension is  $T_2$  and the new frequency becomes  $2f_1$  (it increases by 100%):

$$2f_1 = \frac{1}{2(\frac{3}{4}l)} \sqrt{\frac{T_2}{\mu}}$$

### Step 4: Set Up the Equation

Now, make it easier by expressing  $2f_1$  in terms of the formula:

$$2f_1 = \frac{1}{(\frac{3}{2})l} \sqrt{\frac{T_2}{\mu}}$$

Because splitting the denominator gives  $2 \times \frac{1}{2(\frac{3}{4}l)} = \frac{1}{(\frac{3}{2})l}$ .

### Step 5: Plug $f_1$ from Step 2 into the New Equation

Replace  $f_1$  in the new formula using the old frequency formula:

$$2 \left( \frac{1}{2l} \sqrt{\frac{T_1}{\mu}} \right) = \frac{1}{(\frac{3}{2})l} \sqrt{\frac{T_2}{\mu}}$$

### Step 6: Simplify the Equation

Multiply both sides to clear out the denominators:

$$\frac{1}{l} \sqrt{\frac{T_1}{\mu}} = \frac{2}{3l} \sqrt{\frac{T_2}{\mu}}$$

Multiply both sides by  $3l$ :

$$3\sqrt{\frac{T_1}{\mu}} = 2\sqrt{\frac{T_2}{\mu}}$$

**Step 7: Get Rid of Square Roots by Squaring Both Sides**

Square each side to eliminate the square roots:

$$9\frac{T_1}{\mu} = 4\frac{T_2}{\mu}$$

The  $\mu$  cancels out:

$$9T_1 = 4T_2$$

**Step 8: Find  $\frac{T_2}{T_1}$**

Divide both sides by  $4T_1$  to solve for  $\frac{T_2}{T_1}$ :

$$\frac{T_2}{T_1} = \frac{9}{4}$$

---

## Question21

**An object of height 3.6 cm is placed normally on the principal axis of a concave mirror of radius of curvature 30 cm . If the object is at a distance of 10 cm from the principal focus of the mirror, then the height of the real image formed due to the mirror is**

**Options:**

A.

5.4 cm

B.

3.6 cm

C.

1.8 cm

D.

2.7 cm

**Answer: A**

**Solution:**

Focal length of concave mirror

$$f = \frac{R}{2} = \frac{-30}{2} = -15 \text{ cm}$$

Object distance from the pole of the mirror

$$u = -(f + 10) = -(-15 + 10) = 5 \text{ cm}$$

According to question, for real image formed by a concave mirror, the object must be placed beyond the focal point. If the object is 10 cm from the principle focus and the focal length is 15 cm, the object distance from the pole is

$$u = -(15 + 10) = -25 \text{ cm}$$

Using mirror formula,

$$\begin{aligned}\frac{1}{f} &= \frac{1}{u} + \frac{1}{v} \\ \Rightarrow \frac{1}{-15} &= \frac{1}{-25} + \frac{1}{v} \\ \Rightarrow \frac{1}{v} &= \frac{1}{25} - \frac{1}{15} = \frac{-2}{75} \\ \therefore v &= -37.5 \text{ cm} \\ \therefore m &= \frac{h_i}{h_0} = \frac{-v}{u} \\ \Rightarrow \frac{h_i}{3.6} &= \frac{-37.5}{-25} \\ \Rightarrow h_i &= -5.4 \text{ cm}\end{aligned}$$

The negative sign indicates that the image is real and inverted.

---

## Question22

**Monochromatic light of wavelength  $6000\text{\AA}$  incidents on a small angled prism. If the angle of the prism is  $6^\circ$ , the refractive indices of the material of the prism for violet and red lights are respectively 1.52 and 1.48, then the angle of dispersion produced for this incident light is**

**Options:**

A.

$30^\circ$

B.

$36^\circ$

C.

24°

D.

0°

**Answer: D**

**Solution:**

To find the angle of dispersion, we use the formula:

$$\delta = (n_1 - n_2)A$$

Here,  $n_1$  and  $n_2$  are the refractive indices for violet and red lights, and  $A$  is the prism's angle.

Plug in the values:  $n_1 = 1.52$ ,  $n_2 = 1.48$ ,  $A = 6^\circ$ .

$$\delta = (1.52 - 1.48) \times 6 = 0.04 \times 6 = 0.24^\circ$$

So, the angle of dispersion is  $0.24^\circ$ , which is about  $0.2^\circ$ .

---

## Question23

**In Young's double slit experiment, if the distance between 5th bright and 7th dark fringes is 3 mm , then the distance between 5th dark and 7th bright fringes is**

**Options:**

A.

6 mm

B.

3 mm

C.

5 mm

D.

4 mm

**Answer: C**

**Solution:**

**Step 1: Find the position equations for the fringes.**

The position of the  $n$ th bright fringe is given by:  $y_n = \frac{nD\lambda}{d}$

So, for the 5th bright fringe:  $y_5 = \frac{5D\lambda}{d}$

The position of the  $n$ th dark fringe is:  $y_n = \frac{(2n-1)D\lambda}{2d}$

For the 7th dark fringe:  $y_7 = \frac{(2 \times 7 - 1)D\lambda}{2d} = \frac{13D\lambda}{2d}$

**Step 2: Use the given distance between 5th bright and 7th dark fringes.**

Distance between the 7th dark and 5th bright fringe:  $y_7 - y_5 = \frac{13D\lambda}{2d} - \frac{5D\lambda}{d}$

First, make the denominators the same:  $\frac{13D\lambda}{2d} - \frac{10D\lambda}{2d} = \frac{3D\lambda}{2d}$

The distance given in the question is 3 mm:  $\frac{3D\lambda}{2d} = 3 \times 10^{-3} \text{ m}$

**Step 3: Find the value of  $\frac{D\lambda}{d}$ .**

Divide both sides by 3:  $\frac{D\lambda}{2d} = 1 \times 10^{-3}$  Now multiply both sides by 2:  $\frac{D\lambda}{d} = 2 \times 10^{-3} \text{ m}$  So,  
 $\frac{D\lambda}{d} = 2 \text{ mm} \dots (i)$

**Step 4: Find the positions needed for the second distance.**

Position of the 7th bright fringe:  $y'_7 = \frac{7D\lambda}{d}$

Position of the 5th dark fringe:  $y'_5 = \frac{(2 \times 5 - 1)D\lambda}{2d} = \frac{9D\lambda}{2d}$

**Step 5: Calculate the distance between 5th dark and 7th bright fringes.**

$y'_7 - y'_5 = \frac{7D\lambda}{d} - \frac{9D\lambda}{2d}$  Make denominators the same:  $\frac{14D\lambda}{2d} - \frac{9D\lambda}{2d} = \frac{5D\lambda}{2d}$

**Step 6: Find the final answer using the value from earlier.**

From (i),  $\frac{D\lambda}{d} = 2 \text{ mm}$ , so:  $\frac{5D\lambda}{2d} = \frac{5}{2} \times 2 \text{ mm} = 5 \text{ mm}$

**Final Answer:** Distance between 5th dark and 7th bright fringes is **5 mm**.

-----

## Question 24

Four electric charges  $2\mu\text{C}$ ,  $Q$ ,  $4\mu\text{C}$  and  $12\mu\text{C}$  are placed on  $X$ -axis at distance  $x = 0, 1 \text{ cm}, 2 \text{ cm}$  and  $4 \text{ cm}$  respectively. If the net force acting on the charge at origin is zero, then  $Q =$

Options:

A.

$-3.5\mu\text{C}$

B.

$$-1.75\mu\text{C}$$

C.

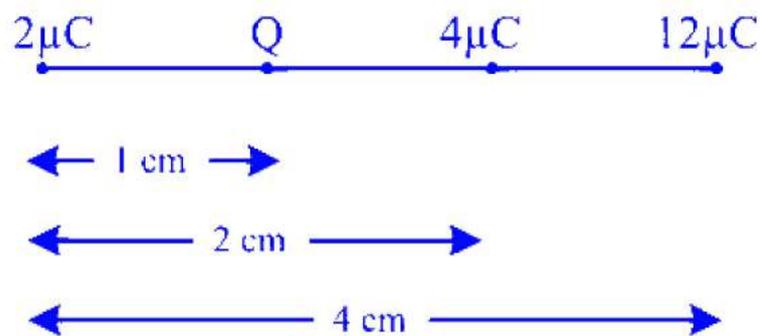

$$-2.75\mu\text{C}$$

D.

$$-5.5\mu\text{C}$$

**Answer: B**

**Solution:**

Net force on the charge at origin = 0

$$\Rightarrow \frac{1}{4\pi\epsilon_0} \left[ \frac{2 \times 10^{-6} Q}{(1 \times 10^{-2})^2} + \frac{2 \times 10^{-6} \times 4 \times 10^{-6}}{(2 \times 10^{-2})^2} + \frac{2 \times 10^{-6} \times 12 \times 10^{-6}}{(4 \times 10^{-2})^2} \right] = 0$$

$$\Rightarrow \frac{Q}{10^{-4}} + \frac{4 \times 10^{-6}}{4 \times 10^{-4}} + \frac{12 \times 10^{-6}}{16 \times 10^{-4}} = 0$$

$$\Rightarrow Q + 10^{-6} + \frac{3}{4} \times 10^{-6} = 0$$

$$\Rightarrow Q + \frac{7}{4} \times 10^{-6} = 0$$

$$\Rightarrow Q = -\frac{7}{4} \times 10^{-6} \text{C} = -\frac{7}{4} \mu\text{F} = -1.75\mu\text{F}$$

---

## Question25

**If a particle of mass 10 mg and charge  $2\mu\text{C}$  at rest is subjected to a uniform electric field of potential difference 160 V , then the velocity acquired by the particle is**

**Options:**

A.

$$9 \text{ ms}^{-1}$$

B.

$$4 \text{ ms}^{-1}$$

C.

$$6 \text{ ms}^{-1}$$

D.

$$8 \text{ ms}^{-1}$$

**Answer: D**

**Solution:**

According to work energy theorem,

$$W = q\Delta V$$

$$\text{KE}_f - \text{KE}_i = q\Delta V$$

$$\frac{1}{2}mv^2 - 0 = 2 \times 10^{-6} \times 160$$

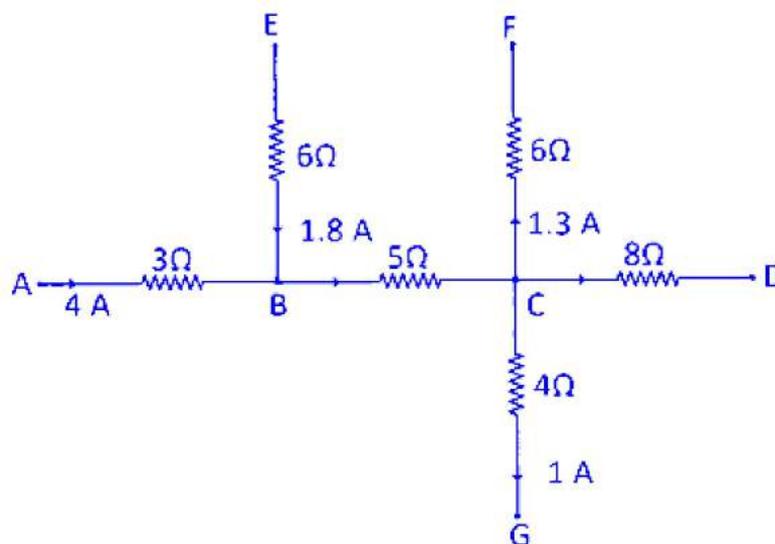

$$\Rightarrow \frac{1}{2} \times 10^{-5}v^2 = 3.2 \times 10^{-4}$$

$$\Rightarrow v^2 = 64 \Rightarrow v = 8 \text{ m/s}$$

---

## Question26

The potential difference between points *C* and *D* of the electrical circuit shown in the figure is

**Options:**

A.

28 V

B.

32 V

C.

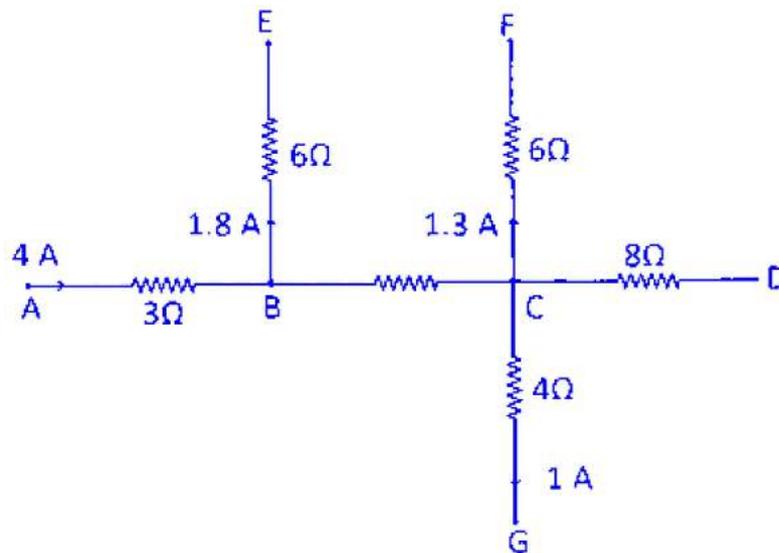

24 V

D.

20 V

**Answer: A**

**Solution:**

Using,  $\Sigma I = 0$ , at  $B$ ,

$$I_{BC} = 4 + 1.8 = 5.8 \text{ A}$$

Also,

At  $C$ ,

$$I_{CD} = 5.8 - 1.3 - 1 = 3.5 \text{ A}$$

So, potential difference between  $C$  and  $D$  is

$$\begin{aligned} V_{CD} &= I_{CD} \times R_{CD} \\ &= 3.5 \times 8 = 28.0 \text{ V} \end{aligned}$$

---

## Question27

The length of a potentiometer wire is 2.5 m and its resistance is  $8\Omega$ . A cell of negligible internal resistance and emf of 2.5 V is connected in series with a resistance of  $242\Omega$  in the primary circuit. The potential difference between two points separated by a distance of 20 cm on the potentiometer wire is

Options:

A.

1.6 mV

B.

4.8 mV

C.

6.4 mV

D.

3.2 mV

**Answer: C**

**Solution:**

$$\begin{aligned}\text{Total resistance, } R &= 242 + 8 \\ &= 250\Omega\end{aligned}$$

$\therefore$  Current in the primary circuit,

$$I = \frac{E}{R} = \frac{2.5}{250} = 0.01 \text{ A}$$

Potential drop across the potentiometer wire,

$$\begin{aligned}V' &= I \times R_{\text{wire}} = 0.01 \times 8 \\ &= 0.08 \text{ V}\end{aligned}$$

$\therefore$  Potential gradient,  $K = \frac{V}{L}$

$$= \frac{0.08}{2.5} = 0.032 \text{ V/m}$$

$\therefore$  Potential difference between two points separated by a distance of 20 cm ,

$$\begin{aligned}V'' &= K \times l = 0.032 \times 0.2 \\ &= 0.0064 \text{ V} \\ &= 6.4 \times 10^{-3} \text{ V} = 6.4\text{mV}\end{aligned}$$

---

## Question28

The magnetic field due to a current carrying circular coil on its axis at a distance of  $\sqrt{2} d$  from the centre of the coil is  $B$ . If  $d$  is the diameter of the coil, then the magnetic field at the centre of the coil is

Options:

A.

$18B$

B.

$27B$

C.

$3B$

D.

$9B$

**Answer: B**

**Solution:**

$$B = \frac{\mu_0 I R^2}{2(R^2 + x^2)^{3/2}}$$

$$\begin{aligned}\text{here, } x &= \sqrt{2}d = \sqrt{2}(2R) \quad (\because d = 2R) \\ &= 2\sqrt{2}R\end{aligned}$$

$$\begin{aligned}\therefore B &= \frac{\mu_0 I R^2}{2R^2 + (2\sqrt{2})^2}^{3/2} \\ &= \frac{\mu_0 I R^2}{2[R^2 + 8R^2]}^{3/2}\end{aligned}$$

$$= \frac{\mu_0 I R^2}{2[(3R)^2]^{3/2}}$$

$$= \frac{\mu_0 I R^2}{2 \times (3R)^3}$$

$$B = \frac{\mu_0 I}{54R} = \frac{1}{27} \times \left( \frac{\mu_0 I}{2R} \right)$$

$$B = \frac{1}{27} \times B_C$$

$$\Rightarrow B_C = 27B$$

---

## Question29

**A square coil of side 10 cm having 200 turns is placed in a uniform magnetic field of 2 T such that the plane of the coil is in the direction of magnetic field. If the current through the coil is 3 mA , then the torque acting on the coil is**

**Options:**

A.

$$12 \times 10^{-3} \text{Nm}$$

B.

$$24 \times 10^{-3} \text{Nm}$$

C.

$$6 \times 10^{-3} \text{Nm}$$

D.

zero

**Answer: A**

## Solution:

$$\begin{aligned}\text{Torque, } \tau &= NLAB \sin \theta \\ &= 200 \times 3 \times 10^{-3} \times (10 \times 10^{-2})^2 \times 2 \times \sin 90^\circ \\ &= 12 \times 10^{-3} \text{ N - m}\end{aligned}$$

---

## Question30

The magnetic field at a point  $P$  on the axis of a short bar magnet of magnetic moment  $M$  is  $B$ . If another short bar magnet of magnetic moment  $2M$  is placed on the first magnet such that their axes are perpendicular and their centres coincide. The resultant magnetic field at the point  $P$  due to both the magnets is

Options:

A.

$$3B$$

B.

$$\sqrt{3}B$$

C.

$$\sqrt{2}B$$

D.

$$2B$$

**Answer: C**

## Solution:

On the axial position of bar magnet

$$B_1 = \frac{\mu_0}{4\pi} \times \frac{2M}{r^3}$$

Similarly,

$$B_2 = \frac{\mu_0}{4\pi} \times \frac{M'}{r^3}$$

here  $m' = 2m$

$$\therefore B_2 = \frac{\mu_0}{4\pi} \cdot \frac{2m}{r^3}$$

Since,  $B_1 = B_2 = B$

$$\begin{aligned}\therefore B_{\text{resultant}} &= \sqrt{B_1^2 + B_2^2} \\ &= \sqrt{B^2 + B^2} = \sqrt{2}B\end{aligned}$$

---

## Question31

**A circular coil of area  $3 \times 10^{-2} \text{ m}^2$ , 900 turns and a resistance of  $1.8\Omega$  is placed with its plane perpendicular to a uniform magnetic field of  $3.5 \times 10^{-5} \text{ T}$ . The current induced in the coil when it is rotated through  $180^\circ$  in half a second is**

**Options:**

A.

2.1 mA

B.

1.8 mA

C.

1.5 mA

D.

2.7 mA

**Answer: A**

**Solution:**

$$\begin{aligned}
\text{Induced emf, } e &= -N \frac{\Delta\phi}{\Delta t} \\
&= -\frac{900(\phi_2 - \phi)}{\Delta t} \\
&= \frac{-900(BA \cos 180^\circ - BA \cos 0^\circ)}{\Delta t} \\
&= -900 \left( \frac{-2BA}{\Delta t} \right) = 900 \times \frac{2BA}{\Delta t} \\
&= \frac{900 \times 2 \times 3.5 \times 10^{-5} \times 3 \times 10^{-2}}{0.5} \\
&= 3.78 \times 10^{-3} \text{ V} \\
\therefore F &= \frac{e}{R} = \frac{3.78 \times 10^{-3}}{1.8} \\
&= 2.1 \times 10^{-3} \text{ A} = 2.1 \text{ mA}
\end{aligned}$$

---

## Question32

**An electric bulb, an open coil inductor, an AC source and a key are all connected in series to form a closed circuit. The key is closed and after some time an iron rod is inserted into the interior of the inductor, then**

**Options:**

A.

the glow of the bulb increases.

B.

the glow of the bulb remains unchanged.

C.

the glow of the bulb decreases.

D.

the bulb does not glow.

**Answer: C**

**Solution:**

When iron rod is inserted into interior of the inductor, then its self inductance increases.

Since,  $X_L = \omega L$

i.e.,  $X_L \propto L$

Thus, due to increase in the value of  $L$ ,  $X_L$  also increases.

Hence, current decreases.

Thus, the glow of the bulb decreases.

---

## Question33

**If the rate of change in electric flux between the plates of a capacitor is  $9\pi \times 10^3 \text{ Vms}^{-1}$ , then the displacement current inside the capacitor is**

**Options:**

A.

$0.36\mu \text{ A}$

B.

$0.25\mu \text{ A}$

C.

$3.14\mu \text{ A}$

D.

$4\mu \text{ A}$

**Answer: B**

**Solution:**

Displacement current

$$\begin{aligned} I_D &= \epsilon_0 \frac{d\phi}{dt} \\ &= 8.854 \times 10^{-12} \times 9\pi \times 10^3 \\ &= 0.25 \times 10^{-6} \text{ A} \\ &= 0.25\mu \text{ A} \end{aligned}$$

---

## Question34

**20 kV electrons can produce X- rays with a minimum wavelength of**

**Options:**

A.

$$0.248\text{\AA}$$

B.

$$0.41\text{\AA}$$

C.

$$0.099 \text{ nm}$$

D.

$$0.062 \text{ nm}$$

**Answer: D**

**Solution:**

To find the smallest (minimum) wavelength of X-rays made by 20 kV electrons, use this formula:

$$\lambda_{min} = \frac{hc}{E} = \frac{hc}{eV} \text{ where:}$$

$$h = \text{Planck's constant} = 6.626 \times 10^{-34} \text{ Js}$$

$$c = \text{speed of light} = 3 \times 10^8 \text{ m/s}$$

$$e = \text{charge of electron} = 1.6 \times 10^{-19} \text{ C}$$

$$V = \text{voltage} = 20,000 \text{ V} = 20 \times 10^3 \text{ V}$$

Plug in the numbers:

$$\lambda_{min} = \frac{6.626 \times 10^{-34} \times 3 \times 10^8}{1.6 \times 10^{-19} \times 20 \times 10^3}$$

Solve the calculation:

$$\lambda_{min} = 0.062 \times 10^{-9} \text{ m}$$

We can also write this as:

$$\lambda_{min} = 0.062 \text{ nm}$$

---

## Question35

**The ratio of wavelengths of second line in Balmer series and the first line in Lyman series of hydrogen atom is**

### Options:

A.

2 : 1

B.

9 : 4

C.

4 : 1

D.

3 : 2

**Answer: C**

### Solution:

$$\frac{1}{\lambda} = R \left( \frac{1}{n_1^2} - \frac{1}{n_2^2} \right)$$

For the second line of Balmer series,

$$n_1 = 2 \text{ and } n_2 = 4$$

$$\begin{aligned} \therefore \frac{1}{\lambda_B} &= R \left( \frac{1}{2^2} - \frac{1}{4^2} \right) \\ &= R \left( \frac{1}{4} - \frac{1}{16} \right) = \frac{3R}{16} \end{aligned}$$

$$\Rightarrow \lambda_B = \frac{16}{3R}$$

For the first line of Lyman series,

$$n_1 = 1 \text{ and } n_2 = 2$$

$$\therefore \frac{1}{\lambda_L} = R \left( \frac{1}{1^2} - \frac{1}{2^2} \right) = R \left( 1 - \frac{1}{4} \right) = \frac{3R}{4}$$

$$\therefore \lambda_L = \frac{4}{3R}$$

$$\therefore \frac{\lambda_B}{\lambda_L} = \frac{\frac{16}{3R}}{\frac{4}{3R}} = \frac{4}{1}$$

$$\therefore \lambda_B : \lambda_L = 4 : 1$$

## Question36

**A radioactive material of half-life 2.5 hours emits radiation that is 32 times the safe maximum level. The time (in hours) after which the**

**material can be handled safely is**

**Options:**

A.

10

B.

25

C.

5

D.

12.5

**Answer: D**

**Solution:**

The safe level of radiation is 32 times less than what the material gives off now.

Each time a half-life (2.5 hours) passes, the radiation becomes half of what it was before.

We can write this as:  $\left(\frac{1}{2}\right)^n = \frac{1}{32}$  where  $n$  is the number of half-lives needed until the radiation is safe.

We know  $\frac{1}{32} = \left(\frac{1}{2}\right)^5$ . So,  $n = 5$ .

This means it takes 5 half-lives to reach a safe level.

**Calculating total time:**

$$\frac{t}{T_{1/2}} = 5 \Rightarrow t = 5 \times T_{1/2}$$

Each half-life is 2.5 hours, so total time is:

$$t = 5 \times 2.5 = 12.5 \text{ hours}$$

---

## Question37

**If the number of uranium nuclei required per hour to produce a power of 64 kW is  $7.2 \times 10^{18}$ , then the energy released per fission is**

**Options:**

A.

$$0.64 \times 10^{-10} \text{ J}$$

B.

$$3.2 \times 10^{-13} \text{ J}$$

C.

$$0.32 \times 10^{-10} \text{ J}$$

D.

$$3.2 \times 10^{-10} \text{ J}$$

**Answer: C**

**Solution:**

$$E = P \times t$$

$$= 64 \times 10^3 \times (60 \times 60)$$

$$= 64 \times 10^3 \times 3.6 \times 10^3$$

$$= 2.3 \times 10^8 \text{ J}$$

$$\therefore \text{Energy released per fission} = \frac{E}{N}$$

$$= \frac{2.304 \times 10^8}{7.2 \times 10^{18}} = 0.32 \times 10^{-10} \text{ J}$$

## Question38

**According to a graph drawn between the input and output voltages of a transistor connected in common emitter configuration, the region in which transistor acts as a switch is**

**Options:**

A.

cutoff or saturation region

B.

active region

C.

active or saturation region

D.

cutoff or active region

**Answer: A**

## **Solution:**

To use transistor as a switch in a common emitter configuration, the transistor operates in cutoff and saturation region.

In cutoff region, the transistor is "off" and acts like an open switch, allowing no current to flow between the collector and emitter.

In saturation region, the transistor is "on" and acts like a closed switch (short circuit) between the collector and emitter, allowing maximum current to flow.

In active region, transistor works as an amplifier.

---

## **Question39**

**If the energy gap of a semiconductor used for the fabrication of an LED is nearly 1.9 eV , then the color of the light emitted by the LED is**

**Options:**

A.

white

B.

red

C.

green

D.

blue

**Answer: B**

**Solution:**

$$\begin{aligned}\lambda &= \frac{hc}{E} \\ &= \frac{6.62 \times 10^{-34} \times 3 \times 10^8}{1.9 \times 1.6 \times 10^{-19}} \\ &= 6.53 \times 10^{-7} \text{ m} \\ &\simeq 653 \text{ nm}\end{aligned}$$

The visible light spectrum ranges approximately 400 nm (violet) to 700 nm (red). A wavelength of 653 nm falls within the red part of the spectrum. Therefore, the colour of the light emitted by the LED is red.

---

## Question40

**When the receiving antenna is on the ground, the range of a transmitting antenna of height 980 m is (Radius of the Earth = 6400 km )**

**Options:**

A.

56 km

B.

112 km

C.

72.4 km

D.

224 km

**Answer: B**

**Solution:**

$$\begin{aligned}\text{Range, } d &= \sqrt{2Rh} \\ &= \sqrt{2 \times 6400 \times 10^3 \times 980} \\ &= 112 \times 10^3 \text{ m} = 112 \text{ km}\end{aligned}$$
